# SECTION 1 INTRODUCTION

#### 1.1 GENERAL

The Varian Data 620/i Computer is a high-speed, parallel, binary computer. Its flexible design and modular packaging make it ideal for operation both as a general-purpose machine and for application as an on-line system component. Its features include:

Fast operation: 1.8-microsecond memory cycle.

Large instruction 107 standard, 18 optional; with

repertoire: approximately 200 additional instruction configurations which

can be microcoded.

Word length: 16- or 18-bit configurations.

Modular memory: 4096 word minimum, 32,768 words

maximum.

Multiple addressing

modes:

Direct, indirect, relative, index, immediate, and extended (optional).

Flexible I/O: Up to 10 devices may be placed on

the I/O bus. The I/O system is easily expandable to include features such as automatic block transfer, priority interrupt, and "cycle-stealing" data transfers.

Extensive software: Complete package includes an

assembler, mathematics and I/O library, AID diagnostics, and an

ASA FORTRAN subset.

Modular packaging: Mounts in a standard 19-inch

cabinet. No special mechanical or environmental facilities are

required.

The advanced design techniques used throughout the DATA 620/i system provide solutions to real-time data acquisition, telemetry processing, process control, and simulation problems. In addition, the DATA 620/i is well suited for scientific computations. Special attention has been given to the interfacing problems usually encountered in integrating a digital computer into a system. As a result, the DATA 620/i can be joined to a system with unparalleled efficiency.

The unique design of the DATA 620/i makes it easy to program, operate and maintain. The entire mainframe includes the processor, all processor options, and a 4096-word core memory in a convenient 10-1/2 inch high rack-mountable package. Only 17 circuit boards of 11 different types are used in the basic 16-bit configuration.

Power supplies for the processor and up to 8192 words of core memory are a separate 10-1/2 inch high package that mounts behind the mainframe. Thus, the entire computer requires only 10-1/2 inches of a standard 19-inch rack. Installation is easy, requiring no special mounting, cabling, or air conditioning provisions.

Maintainability of the DATA 620/i is enhanced by easy front access to all wiring, making it unnecessary to remove panels on the computer rack to obtain access to the modules, connectors, and wiring.

A complete set of software provided with the DATA 620/i permits rapid preparation of application programs. The system software includes:

FORTRAN:

Subset of ASA FORTRAN.

DATA 620/i Assembly System (DAS):

Two-pass symbolic assembler.

AID:

On-line debugging and utility

package.

MAINTAIN:

Complete set of computer and

peripheral diagnostics.

Subroutine Library:

Complete library of transcendental functions, single- and double-precision and floating-point arithmetic, format conversion, and peripheral service routines.

A wide variety of peripheral equipment is available to provide the DATA 620/i user with a complete system suited to specific needs.

1.2 SPECIFICATIONS

Specifications of the DATA 620/i computer are listed in table 1-1.

Table 1-1. DATA 620/i Specifications

Specification		Characteristics
Туре	General-purpose digital applications. Magnetic single-address, with bus	computer for on-line data system core memory: binary, parallel, organization.
Memory	seconds full-cycle, 700 words minimum, expando 32,768 words. Power-fo	(18 bits optional); 1.8 micro- D-nanosecond access time, 4096 able in 4096-word modules to ailure protection optional, non- -load protection is standard.
Arithmetic	Parallel, binary, fixed	point, 2's complement.
	Word Length	16 bits standard; 18 bits optional.
	Speed (fetch and execute)	
	Add or Subtract	3.6 microseconds.
	Multiply (optional)	16 bits - 18.0 microseconds. 18 bits - 19.8 microseconds.
·	Divide (optional)	16 bits - 18.0 to 25.2 microseconds. 18 bits - 19.8 to 28.8 microseconds.
	Register Change	1.8 microseconds.
	Input/Output	From A or B register - 3.6 microseconds.
		From memory - 5.4 microseconds.
	Registers	
	A Register	Accumulator, input/output, 16 or 18 bits.
	B Register	Low-order accumulator, input/output, index register, 16 or 18 bits.
	X Register	Index register, multi-purpose register, 16 or 18 bits.

Table 1-1. (Continued)

Specification		Characteristics	
	P Register	Instruction counter, 16 or 18 bits.	
	U Register	Instruction register, 16 bits.	
	L Register	Memory address register, 16 bits.	
	W Register	Memory word register, 16 or 18 bits.	
	S Register	Shift register, 5 bits.	
	R Register	Operand register, 16 or 18 bits.	
	Control		
	Addressing Modes	Six as follows:	
	Direct: to 2048 words.		
	Relative to P register:	to 512 words.	
	Index with X register hardware: to 32,768 words (does not add to execution time).		
	Index with B register hardware: to 32,768 words (does not add to execution time).		
	Multilevel indirect: to 32,768 words.		
	Immediate		
	Extended: (optional):	to 32,768 words.	
Instruction Types	Four, as follows:		
	Single word, addressing. Single word, nonaddressing Double word, addressing. Double word, nonaddressing		
Instructions	107 standard, approxin 18 optional.	nately 200 microinstructions, plus	
Micro-EXEC (optional)	Facility and hardware external to the DATA of memory accessing for h	to construct a hardwired program 620/i. Eliminates stored program nardwired programs.	

Table 1-1. (Continued)

Specification	Characteristics
Control Panel	Selectable display and data entry switches, three sense switches, instruction repeat, single step, run, power on/off, system reset.
Input Output	
Data Transfer	Three types as follows:
	Single word to/from memory (program control). Single word to/from A and B registers (program control). Optional direct memory access (cycle-steal).
External Control (select)	Up to 512 external control lines.
Program Sense	Up to 512 status lines may be sensed.
Interrupts (optional)	Power failure, priority interrupts (expandable in groups of eight) with group enable/disable and individual arm/disarm. Each interrupt line is associated with a unique memory location.
Physical Characteristics	
Dimensions	10-1/2 inches high, 13 inches deep.
Weight	90 pounds, including power supplies.
Power	360 watts, single phase, 115 vac ± 10 vac, 48–62 Hz. Power supplies are regulated. Additional regulation is not required with normal commercial power sources.
Expansion	Mainframe package contains a 4096-word memory, the processor, and space for processor options. Additional memory requires an additional 10-1/2 inches of rack height for up to 8192 words of additional storage.  Peripheral controllers are mounted external to the mainframe.
Installation	Mainframe and power supply packages require 10–1/2 inches of standard 19–inch racks. No air–conditioning, subflooring, special wiring, or site preparation is required.
Environment	10°C to 45°C, 10% to 90% relative humidity (without condensation).

Table 1-1. (Continued)

Specification	Characteristics
Logic and Signals	The logic of the computer utilizes DTL and TTL integrated circuits employing 5-volt levels. The logic levels on the transmission buses (I/O bus, interrupt bus, etc.) are also +3 v to reduce cross talk and current requirements. Internal logic conventions are 5 v for logical 1, and 0 v for logical 0. Logic conventions on the buses are +3 v for logical 0, and 0 v for logical 1.
Software	
DAS Assembler	Modular two-pass symbolic assembler which operates within the base 4096-word memory. It includes 17 basic pseudoops. The 8192-word memory version includes over 30 pseudo-ops for programming ease.
FORTRAN	Modular one-pass compiler; subset of ASA FORTRAN for 8192-word memory.
AID	Program analysis package which assists programmers in operating the machine and debugging other programs. Includes basic operational executive subroutines.
MAINTAIN	Modular, two-mode diagnostic package which provides fast verification of central processor and peripheral operation, and assists in isolating and correcting suspected faults.
Subroutines	Complete library of basic mathematical, fixed- and floating-point, single- and double-precision, number conversion and peripheral communication subroutines plus provisions for adding application-oriented routines.

### 1.3 USE OF THIS MANUAL

This manual provides the basic information required for programming and using the DATA 620/i, and is intended to be used in conjunction with other publications for the 620-series computers. These publications are listed in table 1-2.

The interface reference manual provides detailed information for integrating the DATA 620/i with special system components.

Table 1-2. DATA 620/i Documents

Publication Number	Title
98 A 9902 003	System Reference Manual
98 A 9902 014	Interface Reference Manual
98 A 9902 023	Programming Reference Manual
98 A 9902 031	FORTRAN Reference Manual
98 A 9902 041	Subroutine Descriptions Manual
98 A 9902 052	Maintenance Manual
98 A 9902 110	Buffer Interlace Controller Manual
98 A 9902 120	Magnetic Tape Controller Manual (7–Track)
98 A 9902 140	Magnetic Tape Controller Manual (9–Track)
98 A 9902 150	Paper Tape Controller Manual
98 A 9902 160	Teletype Controller Manual
98 A 9902 170	Analog Input System Manual
98 A 9902 200	Digital Plotter Controller Manual
98 A 9902 210	Disc Controller Manual
98 A 9902 230	DCC1 Comm. Controller Manual
98 A 9902 260	Card Reader Controller Manual
	Information required by the programmer for using
	the software packages is contained in the program-
	ming reference, FORTRAN, and subroutine
	description manuals.
	The maintenance manual contains detailed design theory, timing diagrams, circuit board data, maintenance procedures, and diagnostic programs.

Detailed design and maintenance information on peripheral device controllers is contained in individual reference manuals for these units. Operation and maintenance procedures for optional peripheral devices (tape transports, printers, etc.) are contained in the manufacturers' reference manuals furnished with the equipment.

Section 2 of this manual contains an overall description of the DATA 620/i system, and describes the word formats used in the computer. Section 3 describes the complete instruction set for the computer. The input/output system, including all input/output, sense, control, and interrupt instructions, is described in section 4. Section 5 provides information required for using the control console of the computer.

# SECTION 2 SYSTEM DESCRIPTION

# 2.1 COMPUTER ORGANIZATION

The DATA 620/i is organized with a unique bus structure, selection logic, and nine registers. The organization provides universal information routing, buffered processing, microprogramming capability, indexing without time penalty, and buffered input/output data transfer. A unique optional facility, Micro-EXEC, is also available which permits complex algorithms to be implemented with external control hardware. This capability provides increases in processing speed in excess of 400 percent over normal programmed operations.

The organization of the DATA 620/i is shown in figure 2-1. This diagram shows the major functional elements of the machine, including the registers and buses provided for information transfer.

The major functional elements of the DATA 620/i, indicated in figure 2-1, are: control section, arithmetic/logic section, operational registers, internal buses, input/output (I/O) bus, and memory.

## 2.1.1 Control Section

The control section provides the timing and control signals required to perform all operations in the computer. The major elements in this section are the U register, the timing and decoding logic, and the shift control.

The U register (instruction register) is 16 bits long. This register receives each instruction from memory through the W bus and holds the instruction during its execution. The control fields of the instruction word are routed to the decoding and timing logic where the codes determine the required timing and control signals. The address field from the U register, used for various addressing operations, is also routed to the arithmetic/logic section.

The decoding logic decodes the fields of the instruction word held in the U register to determine the control signal levels required to perform the operations specified by the instruction. These levels select the timing signals generated by the timing unit.

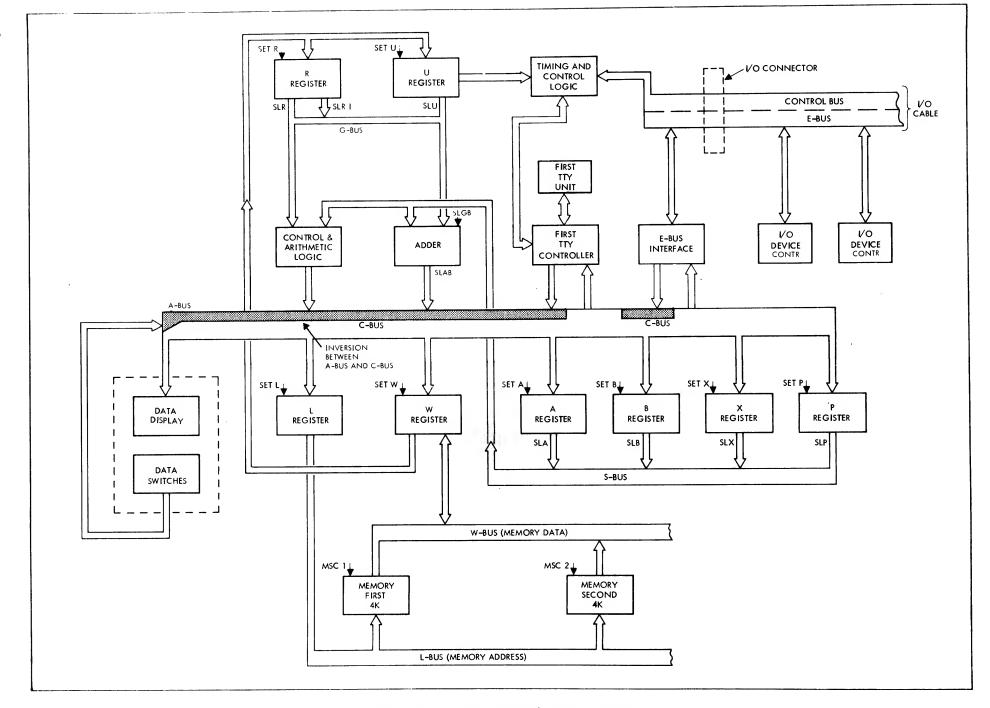

Figure 2-1. DATA 620/i Organization

Timing logic generates the basic, 2.2 MHz system clock. From this clock, timing logic derives the timing pulses which control the sequence of all operations in the computer.

The shift control contains the shift counter and logic to control operations performed by the shift, multiply, and divide instructions.

### 2.1.2 Arithmetic/Logic Section

This section consists of two elements; the R register and the arithmetic unit.

The R register receives operands from memory and holds them during instruction execution. The operand may be either data or address words. This register permits transfers between memory and I/O bus during the execution of extended-cycle instructions.

The arithmetic unit contains gating required for all arithmetic, logic, and shifting operations performed by the computer. Indexed and relative address modifications are performed in this section without increased instruction execution time.

The arithmetic unit also controls the gating of words from the operational registers and the I/O bus onto the C bus where they are distributed to the operational registers or to memory registers. This facility is used to implement many of the microinstructions of the computer.

# 2.1.3 Operational Registers

The basic DATA 620/i computer contains nine registers.

The operational registers consist of the A, B, X, and P registers. The A, B, and X registers are directly accessible to the programmer. The P register is indirectly accessible through use of the jump-class instructions which modify the program sequence. The operational registers are described in the following paragraphs.

A register. This full-length register is the upper half of the accumulator. This register accumulates the results of logical and addition/subtraction operations, the most-significant half of the double-length product in multiplication, and the remainder in division. It may also be used for input/output transfers under program control.

B register. This full-length register is the lower half of the accumulator. This register accumulates the least-significant half of the double-length product in multiplication, and the remainder in division. It may also be used for input/output transfers under program control and as a second hardware index register.

X register. This full-length register permits indexing of operand addresses without adding time to execution of indexed instructions.

<u>Pregister</u>. This full-length register holds the address of the current instruction and is incremented before each new instruction is fetched. A full complement of instructions is available for conditional and unconditional modification of this register.

<u>S register</u>. This five-bit register controls the length of shift instructions in combination with the U register.

#### 2.1.4 Internal Buses

The basic computer contains five buses. These are the C, S, W, L, and I/O buses. Buses C, S, W, and L are described in the following paragraphs. The I/O bus is described in paragraph 2.1.5.

 $\underline{C\ bus}$ . This bus provides the parallel path and selection logic for routing data between the arithmetic unit, the I/O bus, the operational registers, and the memory registers. The console display indicators are also driven from the  $C\ bus$ . Distribution of data simultaneously to multiple operational registers is facilitated by this bus.

<u>S bus</u>. This bus provides the parallel path and selection logic for routing data from the operational registers to the arithmetic unit.

<u>W bus</u>. The memory word (W) register is directly connected to all memory modules through the W bus. The bus is bidirectional and time-shared among memory modules.

<u>L bus</u>. The memory address (L) register is directly connected to all memory modules through the L bus. The bus is unidirectional.

# 2.1.5 Input/Output Bus

The standard DATA 620/i is provided with a bidirectional input/output (I/O) bus that permits programmed data transfers between peripheral devices and the computer.

## 2.1.6 Memory

The internal storage of the computer consists of 4096-word modules connected to the L and W buses. The mainframe can accommodate one 4096-word module. Additional modules are added in an additional frame that is attached to the mainframe. The computer memory can be expanded to a maximum of 32,768 words using 4096-word modules. Instruction words read from memory are transferred to the control section for execution. Words may be transferred, under program control, from memory to the arithmetic/logic section, to the operational registers, or to the I/O bus. Words may be transferred, under program control, to memory from the operational registers or the I/O bus. When the direct memory access option is used, the system is capable of direct transfer between memory and peripheral devices on the I/O bus, concurrent with computations.

# 2.1.7 Direct Memory Access

The direct-memory-access (DMA) option allows data transfer into or out of memory modules without disturbing the contents of the operational registers. Only the L and W registers are altered. Access to memory using the DMA facility is on a "cycle-steal" basis and requires 3.1 microseconds of processor time per transfer.

# 2.1.8 Micro-EXEC

The Micro-EXEC option is a unique hardware technique for microstep sequencing of the computer. This option provides hardware logic in which all computer control signals are made available on an external cable connector so that special hardware routines can be constructed. External control and special return instructions are provided for easy program entry and exit.

# 2.2 COMPUTER WORD FORMATS

There are two basic word formats used in the DATA 620/i: data and instruction. The instruction word format is further divided into four types: single-word addressing, single-word non-addressing, double-word addressing and double-word non-addressing.

### 2.2.1 Data Word Format

Data words may contain operands, operand addresses or indirect addresses, depending upon the instruction or addressing mode in process. The data word format is shown in figure 2-2.

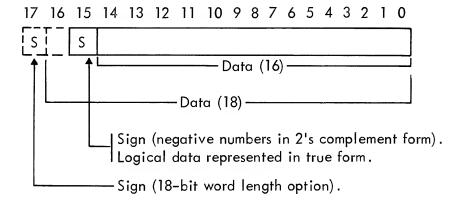

Figure 2-2. Data Word Format

The data word may be either 16 or 18 bits depending upon the word length configuration of the particular machine. In the 16-bit format, data occupy bit positions 0-14, with the sign in position 15. In the 18-bit format, the data occupy bits 0-16, with the sign in position 17. Negative numbers are represented in 2's complement form.

#### 2.2.2 Indirect Address Word Format

A data word may contain an indirect address. An example of an indirect address word format is shown in figure 2-3.

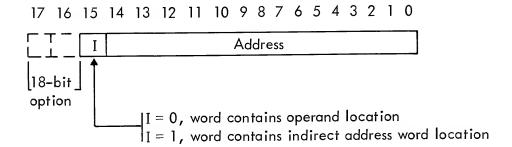

Figure 2-3. Indirect Address Word Format

This word occupies a location in memory which is accessed by an instruction in the indirect address mode. Bit 15 contains the I bit, which designates (I=0) that the memory location being addressed contains the location of the operand, or (I=1) another indirect address word. Indirect addressing may be extended to any desired level. Each level of indirect addressing adds one cycle (1.8 microseconds) to the basic execution time of an instruction.

### 2.2.3 Instruction Word Formats

Instruction words may be either addressing or non-addressing. The instruction word format is shown in figure 2-4.

### 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

	Op-Code Field	M Field	A Field	
[18-bit]				

Figure 2-4. Instruction Word Format

The format shown is applicable to all instruction words. For double-word instructions, the format shown applies to the first instruction word. The instruction word is divided into three fields; op-code field, M field and A field. The function of the three fields varies according to the type of instruction, but may generally be defined as follows:

Op-code field	bits 12-15	Designates type of in- struction (e.g., single- word addressing, I/O instructions or other).
M-field	bits 9-11	Designates address mode or mode of operation
A field	bits 0-8	Contains a variety of information depending upon the type of instruction (see following paragraphs and appendix G).

### 2.2.4 Single-Word Instructions

Addressing Instructions. Addressing instruction groups applicable to this type instruction are: LOAD/STORE, ARITHMETIC and LOGICAL. These instruction groups

are designated by octal numbers 01 through 07, and 11 through 17 in the op-code field. The M field contains one of the following addressing modes:

Direct	binary	0	Χ	Χ
Relative mode	binary	1	0	0
Index (X)	binary	1	0	1
Index (B)	binary	]	1	0
Indirect	binary	1	1	1

For direct addressing, bits 9 and 10 of the M field are combined with the A field to form a direct address to any of 2048 locations. (Table G-1(d), in appendix G explains use of the A field in conjunction with the addressing modes shown above).

Non-addressing instructions. Instruction groups applicable to this type instruction are: SHIFT, CONTROL, REGISTER CHANGE and INPUT/OUTPUT. The op-code field contains octal 00 except for the last type, INPUT/OUTPUT, which is designated by octal 10. The M field designates the mode of operation, and the A field specifies the action to be performed by the computer such as:

- a. Number of shifts
- b. Kind of register change as well as source and destination registers
- c. Input/output

# 2.2.5 Double-Word Instructions

Double-word addressing. This instruction format is shown in figure 2-5.

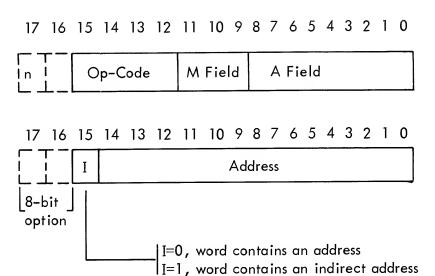

Figure 2-5. Double-Word Addressing Instruction Format

This format is used for the following types of instructions:

**JUMP** 

JUMP AND MARK

**EXECUTE** 

**EXTENDED ADDRESS** 

For all of the above types of instructions, the op-code field contains octal 00; the M field an octal one, two, three or six, designating the mode of instruction to be performed; and the A field (except for EXTENDED ADDRESS) defines a set of nine logical states which condition execution of the instruction. The second word contains the instruction address, or the location of the instruction to be executed if the condition is met. Indirect addressing is permitted.

For extended address type instructions, the A field is further divided into two sub-fields. Bits 0-2 are coded as shown in figure 2-6 to indicate the address mode. Bits 3-8 contain any single-word operation instruction which, in a single word instruction ordinarily appear in the op-code field. The second word contains the effective address which may be direct or indirect depending upon the condition established by bit 15.

Bits 0-2	Address	Effective Address
4	Relative to P	Contents of second word plus (P register plus 1).
5	Indexed with X	Contents of second word plus X register.
6	Indexed with B	Contents of second word plus B register.
7	Direct or Indirect	Contents of second word is the direct address if bit 15 is ZERO. Contents of second word is an indirect address if bit 15 is ONE.

Figure 2-6. Address Modes for Extended Address

Double-Word non-address instruction. This is an immediate type instruction, which uses the same word format as described for the extended type instruction. The op-code field contains octal 00 and the M field contains an octal 6. The A field contains the operation mode (octal 0) in bits 0-3, and bits 3-8 contain a single word operation instruction. Since indirect addressing is not permitted, the second word always contains an operand.

# 2.3 COMPUTER OPTIONS

The following listed options are available for use with the DATA 620/i computer system.

620/i-10 This option provides three additional features for the computer. These are: multiply, divide, and extended addressing.

During multiply, the contents of the B register are multiplied by the contents of a specified memory location. The original contents of the A register are added to the final product. Execution time is 18 microseconds for the basic 16-bit computer; 19.8 microseconds for the 18-bit model.

During divide, the contents of the A and B registers are divided by the contents of a specified memory location. Execution time is 18 to 25.2 microseconds for the basic 16-bit computer; 19.8 to 28.8 microseconds for the 18-bit model.

During extended addressing, all single-word instructions can be programmed as double-word instructions, where the second word contains the effective address of the operand. This option is used with the basic DATA 620/i-00.

620/i-01 Memory/Peripheral Controller Expansion Chassis.
This option provides the necessary power supply and mounting hardware required for the 620/i-02 memory module and/or a peripheral controller chassis. The chassis (backpanel wiring) is divided into halves. Each half can accommodate a 4096-word memory module Alternately, a peripheral control chassis may be installed in the right half. Each peripheral controller chassis can contain up to four controllers.

This option requires 10-1/2 inches of height in a 19-inch rack and mounts below the mainframe.

620/i-02 Memory Module. This option is a 4096-word (16-bit) memory module that provides additional on-line core storage for the standard DATA 620/i-00 computer. The memory has a cycle time of 1.8 microseconds and utilizes a unique stack-temperature compensation scheme that does not require a stack heater.

This concept allows stack temperature to follow ambient temperature but compensate by controlling drive circuits with a simple and unique electronic servo. This servo senses stack temperature and automatically adjusts drive and inhibit currents to their optimum values. This method avoids operation near marginal limits and makes the memory instantly available regardless of ambient temperature.

The memory is expandable to 32,768 words in 4096-word increments. This memory option requires one or more 620/i-01 expansion chassis. Two memory modules can be contained in an expansion chassis. Up to seven 620/i-02 options can be on-line to the computer.

620/i-03 The Memory Parity option is an "odd-bit" parity check system and consists of four functional areas: enable/disable, parity bit generation, parity check, and error response. When the parity option is enabled parity will be checked and errors detected will result in program interrupt(s). The data present on the C bus is examined to determine the polarity of the parity bit which is then stored in memory as the 17th bit of the data word. This is accomplished whether the parity option is enabled or disabled. However, the option must be enabled in order to permit parity check to occur.

When, during a read operation, a parity error is detected, a jump mode is enabled upon completion of the operation in progress, directing the program to a memory address appropriate to the type of operation being performed when the error was detected. Fixed memory locations are reserved for the parity option and are listed below:

Location (optional)	Use
100-103 104-107	Parity In Instruction Word Parity In Address Word
110-113	Parity In Operand Word
114-11 <i>7</i>	Parity In DMA Output

The Memory Parity option is in the DATA 620/i mainframe or in an expansion frame.

620/i-12 Direct Memory Access and Interrupt. This option DMA/I provides "cycle-stealing" capability to the party-line I/O system. It permits external devices to request service from the computer on a priority basis and to interrupt the computer for 3.1 microseconds while the memory is cycled. DMA/I permits data transfers to occur at a rate

of over 200,000 words (16 or 18 bits) per second. This operation does not disturb the operational registers (A, B, X, P) of the computer, thus allowing the program to proceed normally at the conclusion of the data transfer. This option is physically mounted in the DATA 620/i mainframe.

620/i-13 Real-Time Clock. The real-time clock provides a flexible time-orientation system that can be used in a variety of real-time functions, including time-of-day accumulation and as an interval timer.

The real-time clock can generate two interrupts. The first interrupt is a time-base signal that increments a specific memory location when recognized by the computer. The second interrupt occurs when the incremented memory location reaches a count of 40,000. The frequency of the first interrupt can range from 50 Hz to 10 kHz, or an external frequency source can be used. This option is physically mounted in the DATA 620/i mainframe. Fixed memory locations 44 and 45 are reserved for Increment Interrupt and 46 and 47 are reserved for Overflow Interrupt. Direct memory access and interrupt must be installed before this option may be used.

620/i-14 Power Fail/Restart. This option permits automatic recovery and restart of a program when ac line power to the computer is discontinuous.

A power failure is detected when the 115-vac supply falls below an adjustable threshold (105 vac). Any time a power failure is detected, a power-fail interrupt is generated, and memory-data-save and processor-reset operations are initiated before dc power falls below operating level. Fixed memory locations 40 through 43 are reserved for Power Down and Power Up.

This option is installed in the DATA 620/i main-frame.

620/i-16 Priority Interrupt. This option provides the DATA 620/i with a multi-level priority interrupt system that includes single-instruction execute, group enable/disable, and selective arm/disarm capability. Each interrupt line is assigned a unique memory destination address which is the first of a pair of locations. The system is modular and expandable in groups of eight levels. 20(8) fixed memory locations are reserved for each priority interrupt board and are assigned by back plane jumpers. Locations 000 through 177 octal may be used for this assignment. This option is mounted in the DATA 620/i mainframe or in a 620/i-01 expansion chassis.

The interrupt system is automatically scanned every 900 nanoseconds and the interrupt is recognized before the fetch cycle of the next instruction to be executed. If signals exist on one or more interrupt line, the highest-priority interrupt is recognized.

Each group of eight interrupt can be enabled/disabled individually and contains an eight-bit mask register that controls the individual interrupt lines. Acknowledgment of an interrupt by the computer causes the instruction-specified memory address of the interrupt to be accessed. The instruction can be any of the DATA 620/i repertoire. This technique permits an interrupt to be serviced in one instruction period. If the executed instruction is jump and mark, the interrupt system is automatically inhibited, permitting the inhibit to be terminated under program control.

The DATA 620/i interrupt system provides highspeed reaction time, expansion capability, and arm/disarm versatility for real-time control. 620/i-05

Memory Protect. The Memory Protect option provides a means of partitioning core memory whereby the contents of certain memory areas, designated as protected areas, are prevented from being altered by programs operating from areas which are not also protected. This option divides core memory into equal segments of 512 words each. Each segment may be selectively designated as either a protected or unprotected area. When a program is operating from an unprotected area the following operations are prohibited:

b. c.	Write Into Protected Area Jump to Protected Area All I/O Instructions	(0120-0123) (0124-0127) (0130-0133)
d.	Program Overflow Into Protected Area	(0134-0137)

LOCATIONS

If such an operation is attempted, the program will jump to one of four unique locations from which it can be directed to a sub-routine that can analyze and, perhaps, correct the problem.

620/i-11

Negative I/O Option. The negative I/O option provides compatibility between the 620/i Computer and peripheral equipment that uses a negative logic system of 0 volt and -6 volt logic levels. This option provides negative-to-positive and positive-to-negative logic conversion for the data, commands, and control signals which are transmitted between the 620/i Computer and peripheral devices over the negative I/O bus. The data and coded commands are transmitted over a bidirectional E-bus (part of the I/O bus). The controls signals are transmitted over unidirectional control lines.

# SECTION 3 OPERATIONAL INSTRUCTIONS

#### 3.1 GENERAL

This section describes DATA 620/i instructions which effect operations in the computer. Input/output instructions are described in section 4. Information provided for each instruction is as follows:

- a. The mnemonic that is recognized by the DATA 620/i assembler (DAS).
- b. Mnemonic definition.
- Instruction timing.
- d. Instruction description.
- e. Registers altered by execution of the instruction.
- f. Addressing modes permitted.
- g. A flow chart, when required for complete understanding.

Instructions are divided into two classes: single-word and double-word. Each class contains both addressing and non-addressing groups of instructions. Microprogramming operations which can be implemented for various instruction types are summarized in appendix G.

# 3.2 SINGLE-WORD INSTRUCTIONS

Single-word instructions may be either addressing or non-addressing. The addressing instruction groups are load/store, arithmetic (multiply/divide optional), and logical.

The non-addressing instruction groups are control, shift, and register change.

# 3.2.1 Single-Word Addressing Instructions

The format of the single-word addressing class instructions is shown in figure 2-4. The operation is specified by the 0 field (bits 12-15). The address field, A (bits 0-8), contains the base location of an operand in memory. Operand addressing may be in any one of five modes specified by the M field (bits 9-11).

Table G-1 (d), appendix G, summarizes the addressing modes, and tables G-1 (a), G-1 (b), and G-1 (c) summarize the operation codes for the single-word addressing instructions. Figure 3-1 shows the general operand addressing flow for this class of instructions.

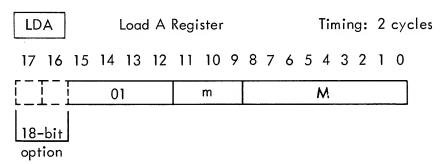

For direct addressing, bits 0-10 specify the location of an operand within the first 2048 (0-2047) words of memory.

For relative addressing, the address field is added to the P register, mod 2<sup>9</sup>, to form the effective address. This mode permits addressing an operand up to 511 words in advance of the current program location.

For index addressing with the X or B register, the address field is added to the X or B register, mod  $2^{15}$ , to form the effective address. Indexing does not increase the basic instruction execution time.

For indirect addressing, the address field specifies the location of an indirect address word within the first 512 (0-511) words of memory. If I=0 in the address word, the word contains the location of an operand. If I=1, the word specifies the location of another indirect address word. Each level of indirect addressing adds one cycle (1.8 microseconds) to the basic instruction execution time.

Load/store instruction group. The following paragraphs provide the mnemonic, description, and timing for each instruction in the load/store group. Figures 3-2 and 3-3 show the general flow for the load/store instruction group.

The contents of the effective memory location are placed in the A register.

Relative: Yes Indexing: Yes

Indirect Addressing: Yes Registers Altered: A

## 3.2.2 Single-Word Non-Addressing Instructions

The format of the single word non-addressing instruction class is shown in figure 2-5.

The non-addressing single-word instructions include the control group, the shift group, and the register change group. The operation is defined by the M field. For the shift group, the A field defines the type and number of shifts. For the register change group, the A field defines the type of transfer and the registers affected.

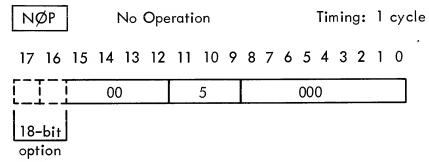

Control instruction group. The following paragraphs provide mnemonic, description, and timing for each instruction in the control group. Table G-2, appendix G, summarizes the control instructions.

When the computer executes the halt instruction, computation is stopped and the computer is placed in the step mode. When the RUN button is pressed, computation starts with the next instruction in sequence.

Shift instruction group. For shift instructions 0-31, the address field, A, defines the type of shift (bits 5-8) and the number of bit positions to be shifted (bits 0-4). The instruction format showing the use of each A-field bit is given in table G-3 (a), appendix G. Twelve of the possible sixteen shift operations defined by bits 5-8 are implemented. These are summarized in table G-3 (b). Figure 3-6 shows the general flow for the shift instructions.

LSRA Logical Shift Right A Timing: 1 + 0.25 n cycles (n = number of shifts)

The contents of the A register are shifted n places to the right (n = 0 to  $37_8$ ). Zeros are shifted into the high-order positions of the A register. Information shifted out of the low-order position of the A register is lost.

The sign of the A register,  $A_{15}$  (A17) is not altered. Information shifted out of  $A_{14}$  (A16) is lost and zeros are shifted into the low-order positions of the B register.

Indexing: No

Indirect Addressing: No Registers Altered: A, B

Register change group. The register change instruction group provides a macrooperation facility, in that these instructions may combine several register change operations in a single instruction. The instruction format is shown in figure 3–7.

The address field (A) defines the source and destination of a parallel word transfer within the operational register set A, B, and X. Any combination of registers may be selected. The A field also specifies whether the word transferred will be unchanged, incremented, decremented, or complemented. The transfer may also be conditional on the overflow indicator.

Table G-4 (a), in appendix G, defines the transfer control specified by the A field. If more than one source register is specified, the result will be the inclusive-OR of the group. Complementing causes transfer of the complement of the inclusive-OR (NOR) of a combination of source registers.

A total of 512 different register change operations are possible. The most useful instructions are contained in the mnemonic repertoire recognized by the DAS assembler, summarized in table G-4(b), appendix G.

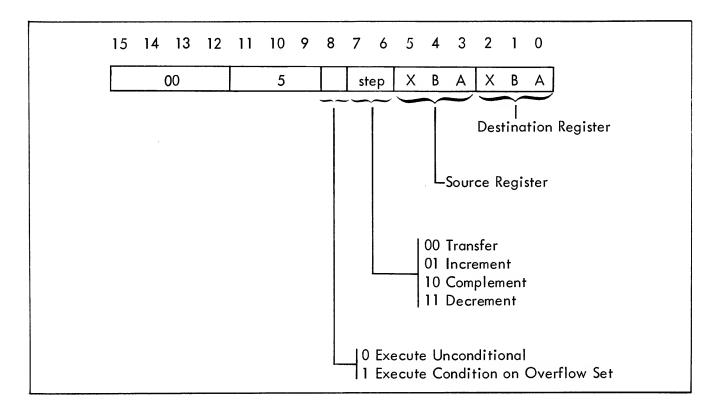

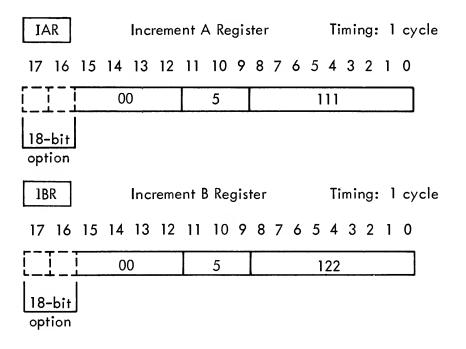

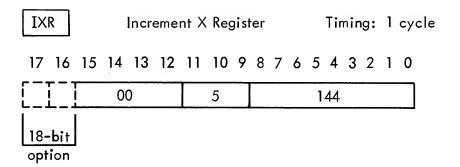

Figure 3-7. Register Change Instruction

The contents of the A (B, X) register are incremented by one, mod  $2^{16}$   $(2^{18})$ . If the sign of the A (B, X) register changes from plus to minus, the overflow indicator (OF) is set.

## 3.3 DOUBLE-WORD INSTRUCTIONS

Double-word instructions may be either addressing or non-addressing. The instructions of the double-word addressing group are jump, jump and mark, execute, and extended addressing.

The instructions in the double-word non-addressing group are the immediate instructions.

## 3.3.1 Double-Word Addressing Instructions

For double-word addressing instructions, the second word is contained in the memory location following the instruction word. The second word contains an address. The address may be either indirect or direct. The general flow chart for double-word instructions is shown in figure 3-8.

Bits 0 through 8 determine the conditions for execution of the instruction. The condition is tested if the corresponding bit is equal to one. For example, if bit 0 equals one, the instruction will examine the status of the overflow flip-flop. If overflow is set, the command will be executed. If overflow is not set, the next instruction in sequence will be executed.

Jump instruction group. For the jump instruction group, the address field A, contains a set of nine flags which define the logical conditions for execution of the jump function. The jump address is contained in the second word of the doubleword instruction. Table G-5(a), in appendix G, summarizes the logical condition associated with each bit in the address

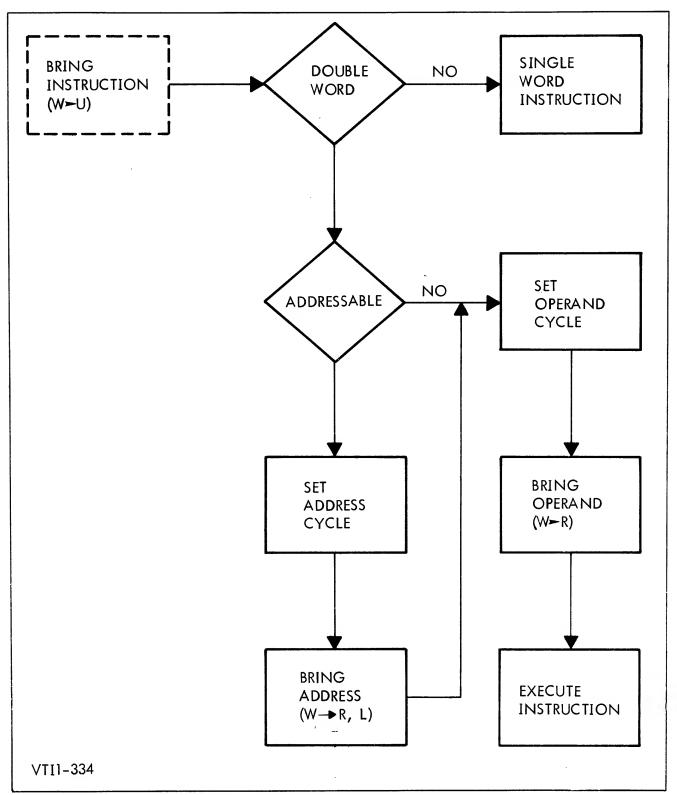

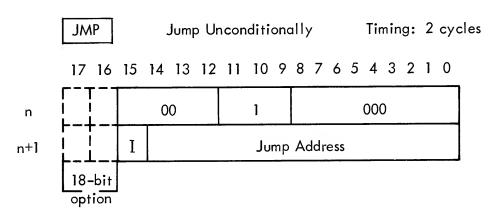

Figure 3-8. Double Word Instruction, General Flow

field. The jump condition is the logical-AND of all ones in the field. Thus, there are 512 possible combinations, but not all are useful. The most useful conditional jump instructions are contained in the mnemonic instruction repertoire recognized by the DAS assembler, summarized in table G-5(b). The general flow for jump instruction is shown in figure 3-9.

The next instruction executed is at the jump address.

Indexing: No

Execute instruction group. For the execute group of instructions, the address field, A, contains a set of nine flags which define the logical conditions for executing an instruction contained at the effective execution address. The execution address is contained in the second word of the double-word instruction. Table G-7 (a), appendix G, summarizes the logical conditions associated with each bit in the address field. The execute condition is the logical-AND of all ones in the A field. The most useful of the 512 possible execute instructions are contained in the mnemonic instruction repertoire recognized by the DAS assembler, summarized in table G-7 (b). Figure 3-11 illustrates the general flow for the execute instructions.

It is important to note that only single-word instructions should be executed. The single-word instruction groups are load/store, arithmetic, logical, control, shift and register change.

If the execute is attempted on double-word instructions, erroneous operations will occur. The double-word instruction groups are jump, jump and mark, execute, extended addressing (optional), and immediate.

The instruction located at the execute address is executed and then the next instruction in sequence is executed.

# SECTION 4 INPUT/OUTPUT SYSTEM

#### 4.1 INTRODUCTION

This section describes the operation and instruction repertoire of the DATA 620/i input/output (I/O) system. The standard computer is equipped with a party line I/O system that has capabilities, under program control, to input data, output data, sense external signals, and generate control signals. The DATA 620/i input/output system is designed to facilitate integration of the computer into an overall system. Refer to the interface reference manual for detailed information required for special interface designs.

A wide selection of peripheral devices can be controlled by the 620/i.

#### 4.2 ORGANIZATION

As shown in the block diagram, figure 2-1, the I/O section of the computer communicates with the operational registers and the memory through the internal C bus. Data and control signals are transmitted to and from external peripheral devices through the I/O bus.

# 4.2.1 Overall Operation

The overall organization of the DATA 620/i I/O system, including a typical set of peripheral devices, is shown in figure 4-1. Standard or special peripheral devices are in parallel on the I/O bus.

The following types of I/O commands can be executed by the standard computer.

Single word to/from memory. A single word may be transferred to or from any memory location.

<u>Single word transfer to/from A or B register</u>. A single word may be transferred to or from the A or B register under program control.

Test external sense line. The computer can sense the status of a selected external line under program control.

Generate external control line. An external control code may be transmitted, under program control, from the computer to an external device.

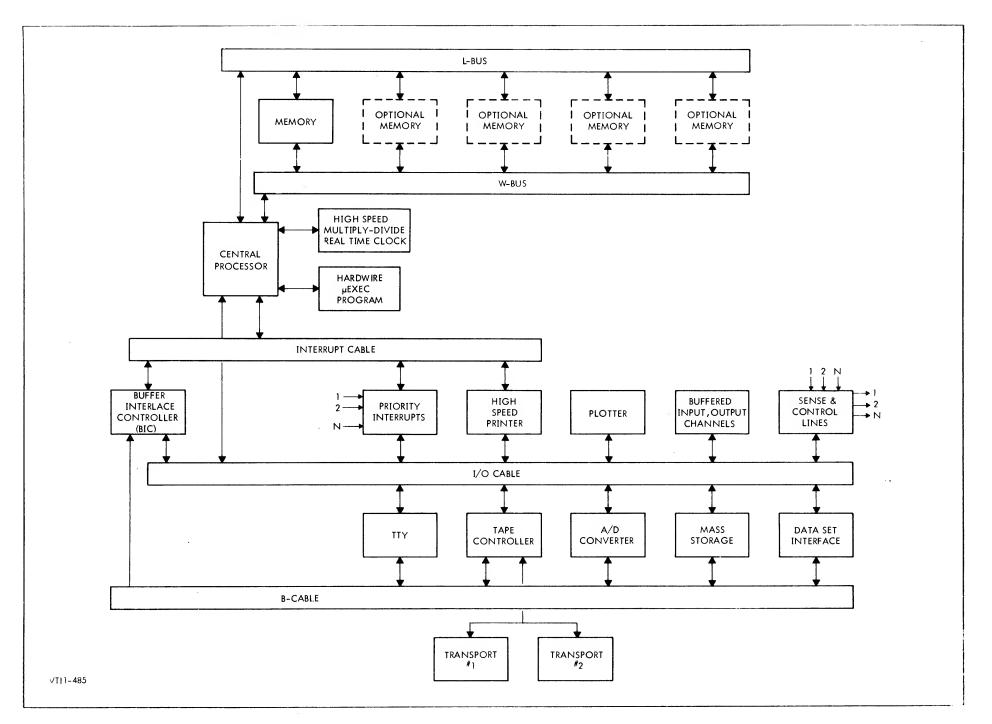

Figure 4-1 System Organization

# 4.2.2 Input/Output Bus Structure

The basic DATA 620/i computer (620/i-00, 622/i-00) is equipped with a positive-voltage-level party-line I/O bus. The party line is a bi-directional common communication channel containing the data and control lines required for system communication. Each transmission on the party line has two phases: The first phase is the route set-up (i.e. device selection); the second is the data transmission.

The party line permits plug-in expansion of all peripheral devices. The party line contains line drivers and line receivers to service up to ten standard peripheral devices. Modifications to the computer are not required to add peripherals. Each standard peripheral device contains a party-line data buffer. Thus, no device can tie-up the party line. The party line technique solves the troublesome problems usually encountered with on-site system expansion.

# 4.2.3 Input/Output Operations

During information transfers over the I/O bus, the E-bus lines may carry control codes, addresses, or data, depending upon the type of operation being performed. Table 4-1 defines the I/O cable standard control signals used to synchronize all I/O operations. Table 4-2 summarizes interrupt control signals in the I/O cable.

#### NOTE

An I/O command is not transmitted intact over the E bus. Bits 11–15 are decoded in the central processor. The processor then generates an E-bus bit (EB11–EB15). Only one of these bits is true for each type of command. Bits 0–8 of the command are transmitted unchanged on the I/O cable.

# 4.3 PROGRAM CONTROL FUNCTIONS

Interfacing functions fall into two major categories: programmed operations and automatic operations. The programmed operations are: external control (single-bit out), sense operations (testing a single bit), data transfer in (full-word input) and data transfer out (full-word output). The following paragraphs describe the programmed operations and examples of their use. The I/O instruction group is summarized in table G-9, appendix G. This group of instructions is standard for the DATA 620/i.

Table 4-1. I/O-Cable Standard Control Signals

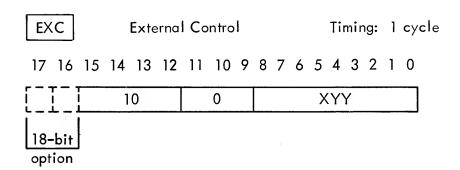

Control Line	Signal Name	Function
Function Ready	FRYX-I	Indicates that the E bus contains control or address information.
Data Ready	DRYX-I	Indicates that the E bus contains data.
Sense Response	SERX-I	Indicates logical state of line queried by sense line address on E bus.
Interrupt Acknowledge	IUAX-I	Indicates that external interrupt or trap demand is being acknowledged. Address is placed on E bus and removed with the function-ready signal.
System Reset	SYRT-I	Reset line for initializing peripheral controllers. Energized by console SYSTEM RESET switch.

Table 4-2. I/O Cable Interrupt Control Signals

Control Line	Signal Name	Function
Interrupt Request	IURX-I	Indicates a demand from the Interrupt module to force program to take one instruction from location specified by address on E bus. This address will be placed on E bus when IUAX-I is true.
Trap-Out Request	TPOX-I	Indicates that a buffer interlace controller or other trap device is requesting data transfer from memory.
Trap-In Request	TPIX-I	Indicates that a buffer interlace controller or other trap device is requesting data transfer to memory.
Interrupt Clock	IUCX-I	1.1-MHz clock provided on cable for interrupt module. May be used in any interface design. This clock is not present if the direct-memory-access-and-interrupt option is not included in the system.
Priority Out	PRIX-I	
Priority In	PR4X-I	Priority lines used with interrupt and buffer-interlace- controller modules for priority determination.
Priority 2 and 3	PR2X-I, PR3X-I	
Interrupt Jump	IUJP-I	Indicates that instruction at interrupt location is a jumpand-mark (two-word) instruction.

### 4.3.1 External Control

The external control instruction is a single word, non-addressing instruction. It places a function code, contained in bits 0-8, on the E bus to initiate a control operation in an external device.

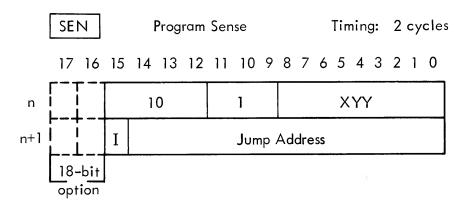

The nine bits represented by XYY are placed on the E bus for transmission to the peripheral controllers. The device address is contained in the YY portion of the data, and the function to be performed by the selected device is contained in the X portion.

Indexing: No

Indirect Addressing: No Registers Altered: None

# 4.3.2 Program Sense

The sense instruction is a double-word, addressing instruction that senses the logical state of an external line. Figure 4-2 shows the execution of this instruction.

I = 0, word contains an address

I = 1, word contains an indirect address

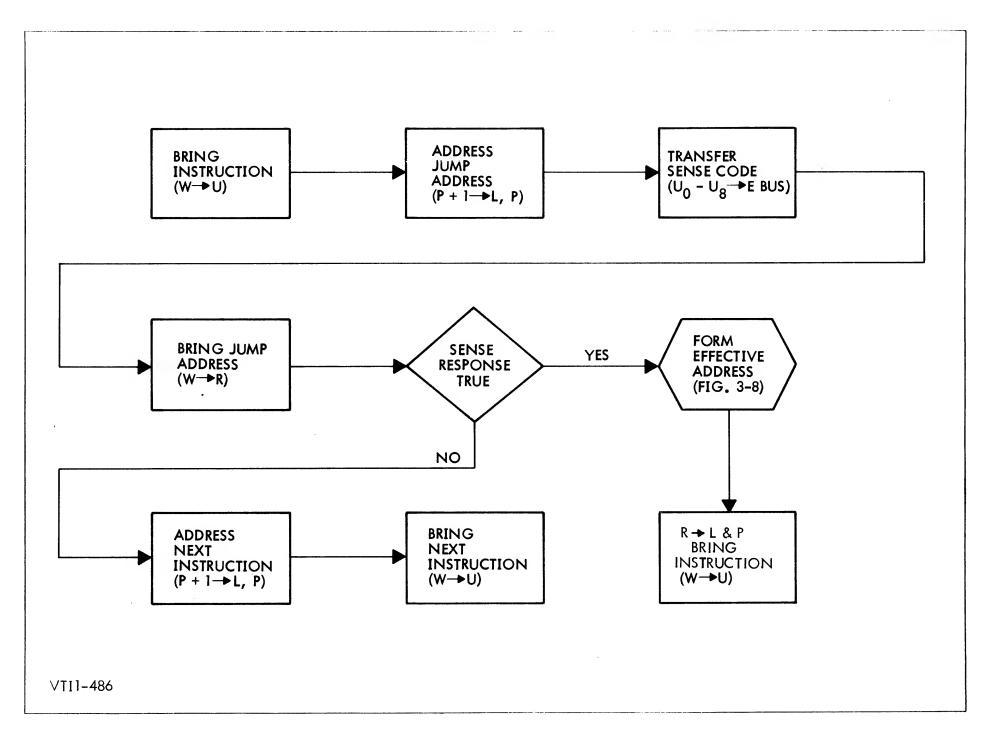

Figure 4-2 Sense Instruction, General Flow

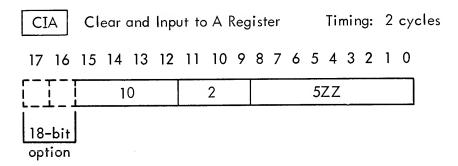

The nine bits represented by XYY are placed on the party line I/O bus and represent the condition to be tested. X defines a specific line within device YY. The associated peripheral controller replies with a true or false signal.

If a true signal is received by the DATA 620/i, a jump is made to the jump address. If a false signal is received, the next instruction in sequence is executed.

Indexing: No Indirect Addressing: Yes Registers Altered: P

# 4.3.3 Data Transfer In

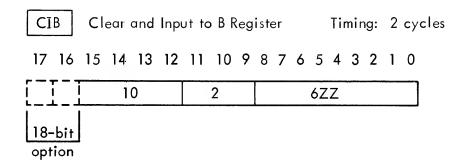

Two types of data transfer in instructions are provided: input to operational registers, and input directly to memory. The first type of input instruction is a single-word, non-addressing instruction; the second type is a double-word addressing instruction.

The A register is cleared and a data word from the selected device, ZZ, is transferred to the A register.

Indexing: No

Indirect Addressing: No Registers Altered: A

The B register is cleared and a data word from the selected device, ZZ, is transferred to the B register.

A data word from the selected device, ZZ, is placed in the cleared effective memory address. Figure 4-3 shows the execution of this instruction.

Indexing: No

Indirect Addressing: No Registers Altered: Memory

# 4.3.4 Data Transfer Out

Two types of output data transfer instructions are provided: output from operational registers and output from memory. The first type of instruction is a single-word, non-addressing instruction; the second type is a double-word, addressing instruction.

The contents of the A register are transferred to the selected device, ZZ.

Indexing: No

Indirect Addressing: No Registers Altered: None

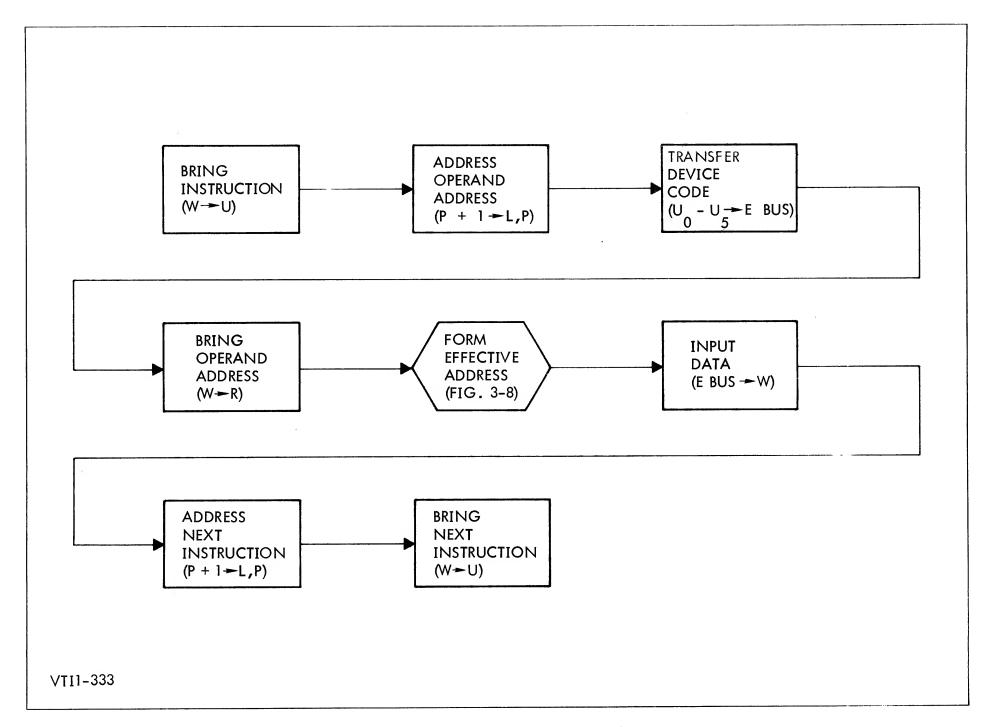

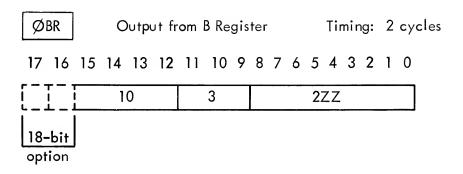

Figure 4-3 Input to Memory, General Flow

The contents of the B registers are transferred to the selected device, ZZ.

Indexing: No

Indirect Addressing: No Registers Altered: None

4.4 OPTIONAL AUTOMATIC CONTROL FUNCTIONS (direct-memory-accessand-interrupt logic option)

Two types of computer timing sequences are provided to automatically transfer control and information signals between peripheral devices and the DATA 620/i:

a. An interrupt timing sequence is initiated when the DATA 620/i recognizes an external interrupt signal. This sequence forces the computer to execute an instruction at the memory location specified by interrupt logic through the E bus.

b. A trap timing sequence is initiated when an external device signals that it must transfer a word to or from memory. The external device must supply the memory address of the word through the E bus. This sequence delays the internal program sequence for the time required to execute the I/O transfer (2.7 microseconds).

The devices that demand either of those automatic sequences must first have priorities to resolve two or more simultaneous demands for service. The priorities of devices demanding service are determined every 0.9 microseconds, and are clocked by the interrupt clock. Refer to the interface reference manual for a more detailed description. Priority assignment for devices on the I/O cable is optional and is a part of the system definition. Priorities may be fixed for any given configuration by properly connecting priority lines in the I/O cable. Priorities can be altered if the definition changes.

# 4.4.1 Interlace Data Transfers

Interlace optional data transfers may be performed concurrently with internal program operation. This type of operation uses the computer trap-timing sequence to delay the program for 2.7 microseconds while a word is transferred between memory and a peripheral device. The transfer is controlled by the external device, which must transmit the memory address of the data word, and must synchronize the operation using the signals transmitted on the I/O control lines. The maximum interlace transfer rate is 202,000 words per second.

The general trap-sequence flow is shown in figure 4-4. The maximum computer delay in acknowledging a trap request is 5.4 microseconds. However, the time delay experienced by a specific controller in receiving acknowledgment to a trap request may be extended by the time required for the computer to service higher-priority requests.

Special peripheral controllers designed for system applications (such as A/D and D/A converters) may utilize the trap facilities of the computer to implement automatic I/O operations (refer to the interface reference manual for detailed design information). A buffer interlace controller (BIC) is also available for use with all standard DATA 620/i peripheral equipment. Special system devices may be interfaced for interlace operations under control of the BIC.

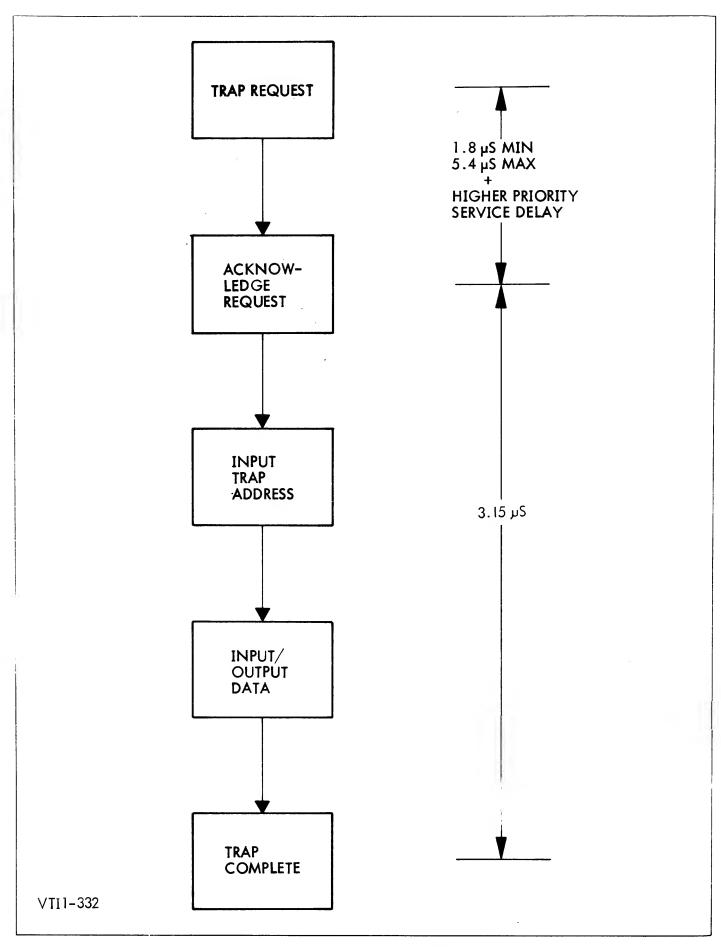

Fig. 4-4 Trap Sequence, General Flow

### 4.4.2 Program Interrupt (optional)

The DATA 620/i has a multi-level interrupt system with single execute, on/off and selective arm/disarm capability. Each interrupt line is assigned a unique memory interrupt address which is the first of a pair of locations. The system is modular and expandable in sets of eight levels.

Each optional interrupt line has an enable/disable flip-flop which is addressable and set by interrupt control instructions. If signals exist on one or more interrupt lines, the highest-priority line is recognized and the corresponding memory destination address is transmitted to the DATA 620/i after the current instruction is executed.

For each group of interrupts, enable is determined by an 8-bit mask word transferred under program control to the arm/disarm flip-flops in the interrupt system. The action initiated by an interrupt subroutine causes the interrupting device to remove its request signal. An acknowledgment of an interrupt causes the instruction located at the interrupt address to be executed. The instruction can be any of the DATA 620/i repertoire. This technique permits the interrupts to be of the singleexecute type, whereby single-instruction responses to external signals can be serviced in one instruction period. A realtime clock can be implemented with an interrupt line and an external pulse generator. An automatic data channel can be implemented with as few as two interrupt lines. If the executed instruction is a jump-and-mark instruction, the interrupt system is automatically inhibited, permitting the inhibit to be terminated under program control. While in the inhibit mode, the interrupt subroutine may selectively enable and disable interrupt levels, and then enable the system, permitting the selected levels to interrupt the level being processed.

# SECTION 5 CONTROL CONSOLE OPERATION

# 5.1 CONTROLS AND INDICATORS

The DATA 620/i console (figure 5-1) provides controls and displays required for operator communication with the computer. The contents of all operational registers, including the instruction register, can be displayed in binary-octal form. During normal operation (run mode) the contents of the computer C bus are displayed continuously. Data entry into a selected operational register is accomplished in the step mode (computer halted) by momentary-contact switches. During the run mode, these switches are inhibited to prevent accidental alteration of the register contents.

Control switches allow the operator to manually alter normal program operation. These switches, described in table 5-1, provide considerable control flexibility and are useful for maintenance, troubleshooting, and program debugging. The sense switches are useful in normal program operation to allow selection of particular program sequences to be executed.

#### 5.2 MANUAL OPERATION

Control console operation may be understood by reference to table 5-1 and figure 5-1. The following paragraphs describe typical operating sequences which illustrate normal use of the computer.

#### 5.2.1 Power Control

The POWER switch applies power to computer logic memory, and controller logic.

### 5.2.2 Manual Program Entry and Execution

When the computer is halted (step mode), programs and data may be read from memory and entered into memory, and a pre-stored program may be manually executed.

To load words into memory (either instructions or data), set the desired word in the A,B, or X register. Set the appropriate store-type instruction (STA, STB, STX) with the desired operand address in the instruction (U) register; then press the STEP switch to execute the store operation.

Figure 5-1. Control Console

Table 5-1. Controls and Indicators

Control or Indicator	Function
Register Display	In-line display of 16 (or 18) bits in selected operational register. Register bits are numbered from right to left with the sign bit appearing on the far left side of the display. Lights are grouped in an octal arrangement. Selection of the register to be displayed is accomplished by the register select switches. During the RUN mode the content of the C bus is displayed regardless of select switch settings.
	Five alternate-action switches used to select one of five registers for display. Only one register may be selected at a time. Selection of two or more registers at the same time disables the selection logic and the register display.
Status Display	Four indicators are provided to indicate the status of the machine. OVFL indicator lights when the overflow flipflop is set. STEP indicator lights when the computer is in the step mode and the Micro-EXEC facility is not being used. RUN indicator lights when the computer is in the run mode. ALARM indicator lights when a thermal overload condition occurs.
RESET Switch	The RESET switch causes the selected register to be cleared. This switch is disabled when the computer is in the run mode.
STEP Switch	The STEP switch is a momentary-contact switch that causes the instruction in the instruction register to be executed if the computer is in the step mode. If the computer is in the run mode, pressing the STEP switch causes the computer to halt at the completion of the instruction being executed.
RUN Switch	The RUN switch causes the program to run at the location specified by the program counter after first executing the instruction in the instruction register.
SYSTEM RESET Switch	The SYSTEM RESET switch is a system-clear control that forces the computer to the halt mode and initializes control flip-flops in the processor. In addition, all peripheral devices are initialized by SYSTEM RESET. This control is normally used as an initialize control, but is useful to halt $I/O$ operations.
REPEAT Switch	Toggle switch that permits manual repeat of an instruction in instruction register. Pressing STEP switch executes instruction and advances program counter; however, contents of the instruction register are left unchanged. Switch on the control console is activated only when the STEP light is on (operation halted).

Table 5-1. (Continued)

Control or Indicator	Function
SENSE Switches 1, 2, 3	Toggle switches that permit manual program control whenever sense-switch-jump, jump-and-mark, or execute instructions (JSS1, JSS2, JSS3, JS1M, JS2M, JS3M, XS1, XS2, XS3) are performed. The indicated jump and execute operations are performed only if the corresponding SENSE switch is ON.
POWER On/Off	Alternate-action switch/indicator that turns power supplies on and off. Indicator/switch is illuminated when power is on; indicator is off when power is off.

To display the contents of any memory cell in the A,B, or X register; set the appropriate load-type instruction (LDA, LDB, LDX) with the proper memory address in the instruction register; then press the STEP switch to load the selected word into the register. To manually execute a program stored in memory, set the starting address of the program in the program counter. When the STEP switch is pressed, the instruction contained in the instruction register is executed, and the instruction of the selected address is transferred to the instruction register. Repeated operation of the STEP switch will then step through the program one instruction at a time. All operations such as multi-level indirect addressing will be performed for each instruction as the STEP switch is operated. Note that I/Oinstructions involving an asynchronous device that transfers data in a block (such as a magnetic tape unit or teletype) generally cannot be operated in the step mode.

### 5.2.3 Instruction Repeat

In the step mode, the instruction register contains the next instruction to be executed when STEP is pressed. The program counter contains the location of the next instruction to be transferred to the instruction register after the current instruction is executed.

In some cases, it is desirable to manually execute an instruction several times. When the REPEAT switch is on, instruction register loading (when STEP is pressed) is inhibited even though the instruction counter is advanced each time. This mode is

particularly useful for loading words into sequential memory locations, or for displaying the contents of sequential memory locations. To load a group of sequential memory cells, set the appropriate store-type instruction (STA, STB, STX) in the instruction register with the relative address mode in the M field and the base address in the A field. Repeated operation of the STEP switch will store the contents of the A, B, or X register into sequential memory locations. The word loaded on each step may be changed by entering the desired value into the operational register for each step.

To display the contents of a group of sequential memory cells, set the appropriate load-type instruction (LDA, LDB, LDX) in the instruction register, in the relative address mode, with the base address in the P register and the A field of the U register = 0. The contents of the sequential locations will be displayed in the selected operational register with each operation of the STEP switch.

### 5.2.4 Sense Switches

The SENSE switches allow the operator to dynamically alter a program sequence in either the run or step mode. The three SENSE switches provide a logical-AND function with bits 6-8 of the jump, jump-and-mark, or execute instruction word, and consequently can be used for various logical branches selected at the console.

Appendix A DATA 620/i Number System

#### DATA 620/i Number System

Binary numbers in the DATA 620/i are represented in 2's-complement form. Single-precision numbers are 15 bits plus sign (16-bit configuration) or 17 bits plus sign (18-bit configuration). The sign bit occupies the most-significant bit position (15 or 17). A "0" in the sign position denotes a positive number; a "1" in the sign position denotes a negative number. The negative of a positive number is represented in 2's-complement form.

The 2's-complement of a number may be found in either of two ways:

a. Take the 1's-complement of the number (i.e., complement each bit); add "1" in the least-significant bit position. Example:

b. For an n-bit number (including sign) subtract it from  $2^{n+1}$ . Example:

2 <sup>n+1</sup>	100000000000000000000000000000000000000
-(+9)	-000000000001001
-9	1111111111110111

It is generally convenient to express binary numbers by their octal equivalent. This conversion is easily performed by grouping the binary bits by threes, starting with the least-significant bit. Thus, in the 18-bit configuration, numbers may be expressed by six full octal digits (000000-777777<sub>8</sub>).

In the 16-bit configuration, the range of octal numbers is less than six full digits  $(000000-177777_8)$ . The octal equivalents for the above examples are:

Decimal	Octal
+9	000011 <sub>8</sub>
-9	177767 <sub>8</sub>

The range of numbers in the DATA 620/i is from  $-2^{15}$  to  $+2^{15}$  -1 for the 16-bit configuration and  $-2^{17}$  to  $+2^{17}$  -1 for the 18-bit configuration. The zero minus 1 and plus/minus full-scale numbers for the 16-bit configuration are:

Binary	Octal	Decimal				
0111]11111111111	077777	+32,767	+Full Scale			
0000000000000000	000000	0	0			
11111111111111111	1 <i>77777</i>	-1	-1			
1000000000000000	1000008	-32,768	-Full Scale			

The negative of the octal equivalent number is found by subtracting the number from 1777778 and adding 1 in the least-significant digit (subtract from 7777778 for the 18-bit configuration). Example:

In performing addition or subtraction, it is possible for the results to exceed the  $\pm$  full scale range of the machine. For example:

Decimal	Oct	ral
+21,980	052734	
+11,843	+027103 <sub>8</sub>	
33,823	102037 <sub>8</sub>	-31,713

The negative result is in error. The same type of error occurs if the sum of the two negative numbers exceeds the minus full-scale range:

Decimal	Octal	
-21,980	125044	
(+)-11,843	150675	
-33,823	(1)075741 <sub>8</sub>	31,803

Note that the carry out of the most-significant octal digit position is generally lost. However, to inform the programmer that the true result of an addition/subtraction falls outside the range of the machine, an overflow indicator is provided. The overflow indicator is set if the sign bit changes when two numbers of the same sign are added together (where the sign of the subtrahend is changed in subtraction).

In multiplication, a double-length product is formed in the arithmetic registers (A or B). Since the product cannot exceed 32-bits (36-bits in the 18-bit configuration), overflow will never occur as the result of a multiply. The sign of the product is automatically determined.

Example:

Decimal	Octal
21,980 X 11,843	052734 027103
65,940 87,920 175,840 21,980 21,980	200624 52734 454404 125670
260,299,140	001741000224 A B

The double-length result is accumulated in the A and B registers.

In division, an overflow (underflow) can occur if the divisor is less than or equal to the dividend.

Appendix B Standard DATA 620/i Subroutines

DATA 620/i Instructions (Alphabetical Order)

Mnemonic	Octal	Description	WDS/ Inst	Time Cycles	Indirect Address
ADD	120000	Add to A Register	1	2	Yes
ADDE*	00612z	Add to A Register Extended	2	3	Yes
ADDI	006120	Add to A Register Immediate	2	2	No
ANA	150000	AND to A Register	1	2	Yes
ANAE*	00615z	AND to A Register Extended	2	3	Yes
ANAI	006150	AND to A Register Immediate	2	2	No
AØFA	005511	Add OF to A Register	1	1	No
AØFB	005522	Add OF to B Register	1	1	No
AØFX	005544	Add OF to X Register	1	1	No
ASLA	00420x+n	Arithmetic Shift Left A n Places	1	1+0.25n	No
ASLB	00400x+n	Arithmetic Shift Left B n Places	1	1+0,25n	No
ASRA	00430x+n	Arithmetic Shift Right A n Places	1	1+0, 25n	No
ASRB	00410x+n	Arithmetic Shift Right B n Places	1	1+0.25n	No
CIA	1025××	Clear and Input to A Register	1	2	No
CIAB	1027××	Clear and Input to A and B Registers	1	2	No
CIB	1026××	Clear and Input to B Register	1	2	No
СРА	005211	Complement A Register	1	1	No
СРВ	005222	Complement B Register	1	1	No
CPX	005244	Complement X Register	1	1	No
DAR	005311	Decrement A Register	1	1	No
DBR	005322	Decrement B Register	1	1	No
x = 0 throug	gh 7; z =	4 through 7			

<sup>\*</sup>Optional Instructions See table 10, appendix G

DIV*   170000   Divide AB Register   16-Bit   18-Bit   1   11-15	Indirect Address
Extended   18-Bit   12-16     DIVI*   006170   Divide AB Register   16-Bit   11-15     DXR	Yes
Immediate   18-Bit   11-15     DXR   005344   Decrement X Register   1   1     ERA   130000   Exclusive OR to A Register   1   2     ERAE*   00613z   Exclusive OR to A Register   2   3     Extended   Exclusive OR to A Register   2   2     Immediate   EXC   100xxx   External Control Function   1   1     HLT   000000   Halt   1   1	Yes
ERA 130000 Exclusive OR to A Register 1 2  ERAE* 00613z Exclusive OR to A Register 2 3  ERAI 006130 Exclusive OR to A Register 2 2  Immediate 2 2  EXC 100xxx External Control Function 1 1  HLT 000000 Halt 1 1	No

Immediate  EXC 100xxx External Control Function 1 1  HLT 000000 Halt 1 1	Yes
HLT 000000 Halt 1 1	No
	No
IAR 005111 Increment A Register 1 1	No
	No
IBR 005122 Increment B Register 1 1	No
IME 1020xx Input to Memory 2 3	No
INA 1021xx Input to A Register 1 2	No
INAB 1023xx Input to A and B Registers     2	No
INB 1022xx Input to B Register 1 2	No
INR 040000 Increment and Replace 1 3	Yes
INRE* 00604z Increment and Replace 2 4 Extended	Yes
INRI 006040 Increment and Replace 2 3 Immediate	No
IXR 005144 Increment X Register 1 1	No
JAN 001004 Jump if A Register Negative 2 2	Yes
JANM 002004 Jump and Mark if A Register 2 2-3  Negative  x = 0 through 7; z = 4 through 7	Yes

\*Optional Instructions. See table 10, appendix G

Mnemonic	Octal	Description	WDS/ Inst	Time Cycles	Indired Addres
JAP	001002	Jump if A Register Positive	2	2	Yes
JAPM	002002	Jump and Mark if A Register Positive	2	2-3	Yes
JAZ	001010	Jump if A Register Zero	2	2	Yes
JAZM	002010	Jump and Mark if A Register	2	2-3	Yes
JBZ	001020	zero Jump if B Register Zero	2	2	Yes
JBZM	002020	Jump and Mark if B Register Zero	2	2-3	Yes
JMP	001000	Jump Unconditionally	2	2	Yes
JMPM	002000	Jump and Mark Unconditionally	2	3	Yes
JØF	001001	Jump if Overflow On	2	2	Yes
JØFM	002001	Jump and Mark if Overflow On	2	2-3	Yes
MISL	002100	Jump and Mark if Sense Switch 1 On	2	2-3	Yes
JS2M	002200	Jump and Mark if Sense Switch 2 On	2	2-3	Yes
JS3W	002400	Jump and Mark if Sense Switch 3 On	2	2-3	Yes
JSS1	001100	Jump if Sense Switch 1 On	2	2	Yes
JSS2	001200	Jump if Sense Switch 2 On	2	2	Yes
JSS3	001400	Jump if Sense Switch 3 On	2	2	Yes
JXZ	001040	Jump of X Register Zero	2	2	Yes
JXZM	002040	Jump and Mark if X Register Zero	2	2-3	Yes
LASL	00440×+n	Long Arithmetic Shift Left n Places	1	1+0.50n	No
LASR	00450x+n	Long Arithmetic Shift Right n Places	1	1+0.50n	No

Mnemonic	Octal	Description		WDS/ Inst	Time Cycles	Indirect Address
LDA	010000	Load A Register		1	2	Yes
LDAE*	0060Iz	Load A Register Extended	d	2	3	Yes
LDAI	006010	Load A Register Immedia	te	2	2	No
LDB	020000	Load B Register		1	2	Yes
LDBE*	00602z	Load B Register Extended	4	2	3	Yes
LDBI	006020	Load B Register Immediat	te	2	2	No
LDX	030000	Load X Register		1	2	Yes
LDXE*	00603z	Load X Register Extended	d	2	3	Yes
LDXI	006030	Load X Register Immedia	te	2	2	No
LLRL	00444x+n	Long Logical Rotate Left n Places	,	1	1+0.50n	No
LLSR	00454x+n	Long Logical Shift Right n Places		1	1+0.50n	No
LRLA	00424x+n	Logical Rotate Left An F	Places	1	1+0.25n	No
LRLB	00404x+n	Logical Rotate Left B n F	Places	1	1+0.25n	No
LSRA	00434x+n	Logical Shift Right A n F	Places	1	1+0.25n	No
LSRB	00414x+n	Logical Shift Right B n P	laces	1	1+0.25n	No
MUL*	160000	1 /	16-Bit 18-Bit	1	10	Yes
MULE*	00616z	1 /	16-Bit 18-Bit	2	11 12	Yes
MULI*	006160	1 /	16-Bit 18-Bit	2	10 11	No
NØP	005000	No Operation		1	1	No
Ø AB	1033××	Output from A and B Reg	gisters	1	2	No
Ø AR	1031xx	Output from A Register	1	1	2	No
ØBR	1032xx	Output from B Register		1	2	No

<sup>\*</sup>Optional Instructions. See table 10, appendix  $\ensuremath{\mathsf{G}}$ 

Mnemonic	Octal	Description	WDS/ Inst	Time Cycles	Indirect Address
ØME	1030xx	Output from Memory	2	3	No
ØRA	110000	Inclusive OR to A Register	1	2	Yes
ØRAE*	006Hz	Inclusive OR to A Register Extended	2	3	Yes
ØRAI	006110	Inclusive OR to A Register Immediate	2	2	No
RØF	007400	Reset Overflow	1	1	No
SEN	101xxx	Sense Input/Output Lines	2	2	Yes
SØF	007401	Set Overflow	1	1	No
SØFA	005711	Subtract OFLO from A Register	1	1	No
SØFB	005722	Subtract OFLO from B Register	1	1	No
SØFX	005744	Subtract OFLO from X Register	1	1	No
STA	050000	Store A Register	1	2	Yes
STAE*	00605z	Store A Register Extended	2	3	Yes
STAI	006050	Store A Register Immediate	2	2	No
STB	060000	Store B Register	1	2	Yes
STBE*	00606z	Store B Register Extended	2	3	Yes
STBI	006060	Store B Register Immediate	2	2	Νo
STX	070000	Store X Register	1	2	Yes
STXE*	00607z	Store X Register Extended	2	3	Yes
STXI	006070	Store X Register Immediate	2	2	No
SUB	140000	Subtract from A Register	1	2	Yes
SUBE*	00614z	Subtract from A Register Extended	2	3	Yes
x = 0 through	gh 7; z =	4 through 7			

<sup>\*</sup>Optional Instructions See table 10, appendix  ${\sf G}$ 

Mnemonic	Octal	Description	WDS/ Inst	Time Cycles	Indirect Address
SUBI	006140	Subtract from A Register Immediate	2	2	No
TAB	005012	Transfer A to B Register	1	ו	No
TAX	005014	Transfer A to X Register	1	1	No
TBA	005021	Transfer B to A Register	1	1	No
TBX	005024	Transfer B to X Register	ז	י	No
TXA	005041	Transfer X to A Register	1	1	No
TXB	005042	Transfer X to B Register	ו	1	No
TZA	005001	Transfer Zero to A Register	1	ī	No
TZB	005002	Transfer Zero to B Register	1	ו	No
TZX	005004	Transfer Zero to X Register	ו	ו	No
XAN	003004	Execute if A Register Negative	2	2	Yes
XAP	003002	Execute if A Register Positive	2	2	Yes
XAZ	003010	Execute if A Register Zero	2	2	Yes
XBZ	003020	Execute if B Register Zero	2	2	Yes
XEC	003000	Execute Unconditionally	2	2	Yes
XØF	003001	Execute if Overflow Set	2	2	Yes
XS1	003100	Execute if Sense Switch 1 Set	2	2	Yes
XS2	003200	Execute if Sense Switch 2 Set	2	2	Yes
XS3	003400	Execute if Sense Switch 3 Set	2	2	Yes
XXZ	003040	Execute if X Register Zero	2	2	Yes

Appendix G
DATA 620/i Instructions (By Type)

### Table G-1 Single-Word Addressed Instructions

Table G-1(a)
Load/Store Instruction Group

0	p Code		
Octal	Mnemonic	Instruction	Timing (Cycles)
01	LDA	Load A Register	2
02	LDB	Load B Register	2
03	LDX	Load X Register	2
05	STA	Store A Register	2
06	STB	Store B Register	2
07	STX	Store X Register	2

Table G-1(b)
Arithmetic Instruction Group

0	Op Code			
Octal	Mnemonic	Inst	ruction	Timing (Cycles)
04 12 14 16	INR ADD SUB MUL(*) DIV(*)	Add Memor	and Replace ry to A emory from A 16-bit 18-bit 16-bit 18-bit	3 2 2 10 11 10-14 11-15

<sup>\*</sup>Optional Instructions

Table G-1(c)
Logical Instruction Group

0	p Code		
Octal	Mnemonic	Instruction	Timing (Cycles)
11 13 15	Øra Era Ana	Inclusive OR, Memory and A Exclusive OR, Memory and A AND Memory and A	2 2 2

 $\label{eq:continuous} \begin{tabular}{ll} Table $G-1(d)$\\ Addressing Modes for Single Word Addressed Instructions \\ \end{tabular}$ 

٨	1 Field		Addressing	Operation
11	10	9	Mode	Фрегатион
0	X	X	Direct	Combine bits 9, 10 with A field (0-8) to form effective address (0000 - 2047).
1	0	0	Relative	Add A field (bits 0-8) to contents of P to form effective address (Mod 2 <sup>15</sup> ).
1	0	1	Index (X Register)	Add A field (bits 0-8) to contents of X to form effective address (Mod 2 <sup>15</sup> ).
1	1	0	Index (B Register)	AddA field (bits 0-8) to contents of B to form effective address (Mod 2 <sup>15</sup> ).
1	1	1	Indirect	A field (bits 0-8) specifies loca- tion of an address word.

Table G-2
Control Instruction Group Codes
(Single-Word, Non-Addressable)

Op Code					
Octal	Mnemonic	M Field	A Field	Instruction	Timing (Cycles)
00	HLT	0	xxx	Halt	1
00	NØP	5	000	No Operation	1
00	RØF	7	400	Reset Overflow	1
00	SØF	7	401	Set Overflow	1

Table G-3
Shift Instruction Group

Table G-3(a)
Instruction Format

Octal	Octal		A Field							
OP Code	M Field	U <sub>8</sub>	U <sub>7</sub>	U <sub>6</sub>	U <sub>5</sub>	U <sub>4</sub>	U <sub>3</sub>	U <sub>2</sub>	υ <sub>1</sub>	U <sub>0</sub>
00	4	0 = A or B	0 = B	0 = Left	0 = Arith. Shift				•	
		1 = A & B	1 = A	1 = Right	l = Logical 0 & l = Rotate 1 & l = Shift Logical					

Table G-3(b)
Instruction Format

U <sub>8</sub>	U <sub>7</sub>	U <sub>6</sub>	U <sub>5</sub>	Mnemonic	Shift Instruction	Timing (Cycles)
0	. 0	0	0	ASLB	Arithmetic Shift B Left	1 + 0.25n
0	0	0	1	LRLB	Logical Rotate B Left	1 + 0.25n
0	0	1	0	ASRB	Arithmetic Shift B Right	1 + 0.25n
0	0	1	1	LSRB	Logical Shift B Right	1 + 0.25n
0	1	0	0	ASLA	Arithmetic Shift A Left	1 + 0.25n
0	1	0	1	LRLA	Logical Rotate A Left	1 + 0.25n
0	1	1	0	ASRA	Arithmetic Shift A Right	1 + 0.25n
0	1	1	1	LSRA	Logical Shift A Right	1 + 0.25n
1	0	0	0	LASL	Long Arithmetic Shift A, B Left	1 + 0.50n
1	0	0	1	LLRL	Long Logical Rotate A, B Registers Left	1 + 0.50n
1	0	1	0	LASR	Long Arithmetic Shift A, B Right	1 + 0.50n
1	0	1	1	LLSR	Long Logical Shift A, B Registers Right	1 + 0.50n
1	1	0	0		Invalid	
1	1	0	1		Invalid	
1	1	1	0		Invalid	
1	1	1	1		Invalid	

Table G-4
Register Change Instruction Group

Table G-4(a)
Instruction Format

	A Field										
Octa	Source				Dest.						
Class Code	M Field	U <sub>8</sub>	U <sub>7</sub>	U <sub>6</sub>	U <sub>5</sub>	U <sub>4</sub>	U <sub>3</sub>	U <sub>2</sub>	U <sub>1</sub>	U <sub>0</sub>	Type of Transfer
00	5	See Not (2)	-	0 1 0 1	×	В	Α	×	В	Α	Transfer Unchanged Transfer Incremented Transfer Complemented Transfer Decremented

NOTES: 1. Multiple source transfer results in inclusive-OR; multiple source complemented results in complement inclusive-OR.

2. Bit-8 is the conditional indicator. If Bit-8 is zero, the instruction is executed unconditionally. If Bit-8 is one, the instruction is executed only if the over-flow is on.

Table G-4(b)
Register Change Instruction Codes

Class Code Field Octal	Mnemonic	Register Change Instruction	Timing
001	TZA	Transfer Zero to A Register	1
002	TZB	Transfer Zero to B Register	1
0 0 4	TZX	Transfer Zero to X Register	1
012	TAB	Transfer A Register to B Register	1
014	TAX	Transfer A Register to X Register	1
021	TBA	Transfer B Register to A Register	1
0 2 4	TBX	Transfer B Register to X Register	1
041	TXA	Transfer X Register to A Register	1
0 4 2	TXB	Transfer X Register to B Register	1
111	IAR	Increment A Register	1
122	IBR	Increment B Register	1
144	IXR	Increment X Register	1
2	CPA	Complement A Register	1
2 2 2	СРВ	Complement B Register	1
2 4 4	CPX	Complement X Register	1
311	DAR	Decrement A Register	1
3 2 2	DBR	Decrement B Register	1
3 4 4	DXR	Decrement X Register	1
511	AØFA	Add Overflow to A Register	1
5 <b>2 2</b>	AØFB	Add Overflow to B Register	1
5 4 4	AØFX	Add Overflow to X Register	1
711	SØFA	Subtract Overflow from A Register	
7 2 2	SØFB	Subtract Overflow from B Register	
7 4 4	SØFX	Subtract Overflow from X Register	

Table G-5
Jump Instruction Group

Table G-5(a)
Instruction Format

Oc					Αŀ	ield				
OP Code	M Field	U <sub>8</sub>	U <sub>7</sub>	U <sub>6</sub>	U <sub>5</sub>	U <sub>4</sub>	U <sub>3</sub>	U <sub>2</sub>	Ul	U <sub>0</sub>
00	1		SS2 ON		X = 0	B = 0	A = 0	A < 0	A ≥ 0	OF = 1

Note: Jump condition is logical AND of all A field bits.

Table G-5(b)
Jump Instruction Codes

A Field Octal	Mnemonic	Jump Instruction	Timing (cycles)
000	JMP	Jump Unconditionally	2
001	JØF	Jump if Overflow Set	2
0 0 2	JAP	Jump if A Register Positive or Zero	2
0 0 4	JAN	Jump if A Register Negative	2
010	JAZ	Jump if A Register Zero	2
020	JBZ	Jump if B Register Zero	2
0 4 0	JXZ	Jump if X Register Zero	2
100	JSSI	Jump if Sense Switch 1 Set	2
200	JSS2	Jump if Sense Switch 2 Set	2
400	JSS3	Jump if Sense Switch 3 Set	2

Table G-6
Jump-and-Mark Instruction Group

Table G-6(a)
Instruction Format

Oct	al	A Field								
OP Code	M Field	U <sub>8</sub>	U <sub>7</sub>	U <sub>6</sub>	U <sub>5</sub>	U <sub>4</sub>	U <sub>3</sub>	U <sub>2</sub>	U <sub>1</sub>	U <sub>O</sub>
00	2	SS3	SS2	SS1	X = 0	B = 0	A = 0	A < 0	A ≥ 0	OF = 1

Note: Jump and Mark condition is logical-AND of all A field bits.

Table G-6(b)
Jump-and-Mark Instruction Codes

A Field Octal	Mnemonic	Jump-and-Mark Instructions	Timing (Cycles)
000	JMPM JØFM	Jump and Mark Unconditionally  Jump and Mark if Overflow Set	3 2 (3 if Jump)
002	JAPM	Jump and Mark if A Register Positive	2 (3 if Jump)
004 010	JANM JAZM	Jump and Mark if A Register Negative  Jump and Mark if A Register Zero	2 (3 if Jump) 2 (3 if Jump)
020	JBZM	Jump and Mark if B Register Zero	2 (3 if Jump)
040 100	JX ZM JS 1M	Jump and Mark if X Register Zero  Jump and Mark if Sense Switch 1 On	2 (3 if Jump) 2 (3 if Jump)
200	JS2M	Jump and Mark if Sense Switch 2 On	2 (3 if Jump)
400	MS3K	Jump and Mark if Sense Switch 3 On	2 (3 if Jump)

Table G-7
Execute Instruction Group

Table G-7(a)
Instruction Format

Octal						Αſ	ield			
OP Code	M Field	U <sub>8</sub>	U <sub>7</sub>	U <sub>6</sub>	U <sub>5</sub>	U <sub>4</sub>	U <sub>3</sub>	U <sub>2</sub>	υ <sub>l</sub>	U <sub>0</sub>
0.0	3		SS2 ON		X = 0	B = 0	A = 0	A 0	A 0	OF = 1

Note: Execute condition is logical-AND of all A field bits. Executed instruction must be single word.

Table G-7(a)
Instruction Format

A Field Octal	Mnemonic	Execute Instruction	Timing (Cycles)
000	XEC	Execute Unconditionally	2
001	XØF	Execute if Overflow Set	2
002	XAP	Execute if A Register Positive	2
004	XAN	Execute if A Register Negative	2
010	XAZ	Execute if A Register Zero	2
020	XBZ	Execute if B Register Zero	2
040	xxz	Execute if X Register Zero	2
100	XS1	Execute if Sense Switch 1 <b>Set</b>	2
200	XS2	Execute if Sense Switch 2 Set	2
400	XS3	Execute if Sense Switch 3 Set	2

Table G-8
Immediate Instruction Group

ОР	Code	Octal			
Octal	Mnemonic	M Field	A Field	Instruction	Timing (Cycles)
00	LDAI	6	010	Load A Immediate	2
00	LDBI	6	020	Load B Immediate	2
00	LDXI	6	030	Load X Immediate	2
00	INRI	6	040	Increment and Replace Immediate	3
00	STAI	6	050	Store A Immediate	2
00	STBI	6	060	Store B Immediate	2
00	STXI	6	070	Store X Immediate	2
00	ØRAI	6	110	Inclusive OR Immediate	2
00	ADDI	6	120	Add Immediate	2
00	ERAI	6	130	Exclusive OR Immediate	2
00	SUBI	6	140	Subtract Immediate	2
00	ANAI	6	150	AND Immediate	2
00	MULI*	6	160	Multiply Immediate 16 bits 18 bits	10 11
00	DIVI*	6	170	Divide Immediate 16 bits 18 bits	10-14 11-15

<sup>\*</sup>Optional Instructions

Table G-9
Input/Output Instruction Group

OF	<sup>o</sup> Code	0	ctal		
Octal	Mnemonic	M Field	A Field	Instruction	Timing (cycles)
10	EXC	0	XZZ	External Control	1
10	SEN	1	XZZ	Program Sense	2
10	IME	2	0ZZ	Input to Memory	3
10	INA	2	1ZZ	Input to A	2
10	INB	2	2ZZ	Input to B	2
10	INAB	2	3ZZ	Input ORed to ORed A and B	2
10	CIA	2	5ZZ	Clear and Input to A	2
10	CIB	2	6ZZ	Clear and Input to B	2
10	CIAB	2	7ZZ	Clear and Input to A	2
10	ØME	3	0ZZ	Output from Memory	3
10	ØAR	3	1ZZ	Output from A	2
10	ØBR	3	2ZZ	Output from B	2
10	ØAB	3	3ZZ	Output Inclusive OR of A and B	2

X - Mode or logical unit number

Z - Device number

Appendix H
DATA 620/i Reserved Instruction Codes

Table H-1. 620/i-06-A Teletype Controller Instructions

	Mnemonic	Octal Code	Functional Description
Α.	External Control		
	EXC 0101	100101	Connect Write Register to BIC
	EXC 0201	100201	Connect Read Register to BIC
	EXC 0401	100401	Initialize
В.	Transfer		
	OAR 01	103101	Transfer A Register to Write Register
	OBR 01	103201	Transfer B Register to Write Register
	OME 01	103001	Transfer Memory Register to Write Register
	INA 01	102101	Transfer Read Register to A Register
	INB 01	102201	Transfer Read Register to B Register
	IME 01	102001	Transfer Read Register to Memory Register
	CIA 01	102501	Transfer Read Register to Cleared A Register
	CIB 01	102601	Transfer Read Register to Cleared B Register
c.	Sense		
	SEN 0101	101101	Write Register Ready
	SEN 0201	101201	Read Register Ready

# D. Teletype Command Codes

Function	Symbol	Code	Typed As	
Print Enable Print Suppress Reader On Punch On Reader Off Punch Off	SOM EOT XON TAPE XOFF TAPE OFF	201 204 221 222 223 224	Control and A Control and D Control and Q Control and R Control and S Control and T	

Teletype models are listed as follows:

620-60B	(ASR-33 TM)
620-61B	(ASR-35 TM)
620-62B	(KSR-35 TM)

Note: External control instructions are for use only with the BIC.

Table H-2. 620/i-10 Multiply/Divide and Extended Addressing Instructions

	Mnemonic	Octal Code	Functional Description	Time/Cycles
Α.	Divide (one-v	word instruction)		
	DIV	170000	Divide AB register 16-bit 18-bit	10-14 11-15
В.	Multiply (one	-word instruction)		
	MUL	160000	Multiply B register 16-bit 18-bit	10 11
c.	Extended Add	 ress (two-word instru	oction)	
	LDAE	00601Z	Load A register extended	3
	LDBE	00602Z	Load B register extended	3
	LDXE	00603Z	Load X register extended	3
	STAE	00605Z	Store A register extended	3
	STBE	00606Z	Store B register extended	3
	STXE	00607Z	Store X register extended	3
	INRE	00604Z	Increment and replace extended	4
	ADDE	00612Z	Add memory to A register extended	3
	SUBE	00614Z	Subtract memory from A register extended	3
	MULE	00616Z	Multiply B register 16-bit extended 18-bit	11 12
	DIVE	00617Z	Divide AB register extended 16-bit 18-bit	11-15 12-16
	ORAE	00611Z	Inclusive OR extended	3
	ERAE	00613Z	Exclusive OR extended	3
	ANAE	00615Z	AND extended	3

Table H-3 620/i-13 Real Time Clock Instructions

Mnemonic	Octal Code	Functional Description
EXC 0147	100147	Enable RTC. Enables both increment and overflow interrupts.
EXC 0447	100447	Disable RTC (initialize). Disables both increment and overflow interrupts, resets interrupt register and "divide-by-eight" counter.
EXC 0247	100247	Disable Overflow. Inhibits overflow interrupt requests.
EXC 0347	100347	Enable Increment/disable overflow. Enables increment interrupt; inhibits overflow interrupts.

Table H-4
620/i-16 Priority Interrupt Module Instructions

Mnemonic	Octal Code	Functional Description
A. External	Control	
EXC 014X*	10014X*	Clear interrupt registers
EXC 024X	10024X	Enable PIM
EXC 034X	10034X	Clear interrupt registers and enable PIM
EXC 044X	10044X	Disable PIM
EXC 054X	10054X	Clear interrupt registers and disable PIM
B. Data Transfer		
ØME 04X	10304X	Transfer memory to mask register
ØAR 04X	10314X	Transfer A register content to mask register
ØBR 04X	10324X	Transfer B register content to mask register

 $<sup>^{*}\</sup>mathrm{X}$  represents the last character of device address. Its value ranges from 0 through 7 and is determined by jumper connections on the PIM backplane.

Table H-5 620/i-20 Buffer Interlace Controller Instructions

Mnemonic	Octal Code	Functional Description
A. External Control		
EXC 020	100020	Active Enable
EXC 021	100021	Initialize
B. Transfer		
ÓAR 020	103120	Load Initial Register from A
ØBR 020	103220	Load Initial Register from B
ØME 020	103020	Load Initial Register from Memory
ØAR 021	103121	Load Final Register from A
ØBR 021	103221	Load Final Register from B
ØME 021	103021	Load Final Register from Memory
INA 020	102120	Read Initial Register into A
INB 020	102220	Read Initial Register into B
IME 020	102020	Read Initial Register into Memory
CIA 020	102520	Read Initial Register into Cleared A
CIB 020	102620	Read Initial Register into Cleared B
C. Sense		
SEN 020	101020	Sense BIC Not Busy
SEN 021	101021	Sense Abnormal Device Stop

Table H-6 620/i-22/23 Card Reader Controllers Instructions

Mnemonic	Octal Code	Functional Description
A. External Control		
EXC 0230	100230	Read One Card
B. Transfer		
IME 030	102030	Transfer Character to Memory
INA 030	102130	Transfer Character to A Reg.
INB 030	102230	Transfer Character to B Reg.
CIA 030	102530	Transfer Character to A Reg., Cleared
CIB 030	102630	Transfer Character to B Reg., Cleared
C. Sense		
SEN 0130	101130	Sense Character Ready
SEN 0230	101230	Sense Reader Error
SEN 0330	101330	Sense Hopper Empty
SEN 0630	101630	Sense Reader Ready

Table H-7 620/i-30 9-track Magnetic Tape System Controller Instructions

Mnemonic	Octal Code	Functional Description
A. External Control		
EXC 010	100010	Read One Record
EXC 0210	100210	Write One Record
EXC 0410	100410	Write File Mark
EXC 0510	100510	Forward One Record
EXC 0610	100610	Backspace One Record
EXC 0710	100710	Rewind
B. Transfer		
OME 010	103010	Output Memory to Magnetic Tape Buffer
OAR 0110	103110	Output A Reg to Magnetic Tape Buffer
○BR 0210	103210	Output B Reg to Magnetic Tape Buffer
IME 010	102010	Input Magnetic Tape Buffer to Memory
INA 0110	102110	Input Magnetic Tape Buffer to A Register
INB 0210	102210	Input Magnetic Tape Buffer to B Register
CIA 0510	102510	Input Magnetic Tape Buffer to A Register Cleared
CIB 0610	102610	Input Magnetic Tape Buffer to B Register Cleared
C. Sense		
SEN 010	101010	Sense Tape Error
SEN 0110	101110	Sense Buffer Ready
SEN 0210	101210	Sense Tape Unit Ready
SEN 0310	101310	Sense File Mark
SEN 0410	101410	Sense Odd Length Record
SEN 0510	101510	Sense End of Tape
SEN 0610	101610	Sense Beginning of Tape
SEN 0710	101710	Sense Rewinding
D. Transport Select		
EXCB 0110	104110	Select Tape Drive No. 1
EXCB 0210	104210	Select Tape Drive No. 2
EXCB 0310	104310	Select Tape Drive No. 3
EXCB 0410	104410	Select Tape Drive No. 4

Table H-8 620/i-31 7-track Magnetic Tape System Controller Instructions

	0 10 1	
Mnemonic	Octal Code	Functional Description
A. External Control		
EXC 010	100010	Read One Record Binary
EXC 0110	100110	Read One Record BCD
EXC 0210	100210	Write One Record Binary
EXC 0310	100310	Write One Record BCD

Table H-11 620/i-65 Data Set Coupler (synchronous) Instructions

Mnemonic	Octal Code	Functional Description	
A. External Control			
EXC 071	100071	Go to Search	
EXC 0171	100171	Connect Write Buffer to BIC	
EXC 0271	100271	Connect Read Buffer to BIC	
EXC 0471	100471	Turn on Request to Send	
EXC 0571	100571	Turn off Request to Send	
EXC 0671	100671	Go to Character Format	
D. T. C			
B. Transfers		χ.	
IME 071	102071	Transfer Read Buffer to 8 LSB of Memory	
INA 071	102171	Transfer Read Buffer to 8 LSB of A Reg.	
INB 071	102271	Transfer Read Buffer to 8 LSB of B Reg.	
CIA 071	102571	Transfer Read Buffer to 8 LSB of A Reg. cleared	
CIB 071	102671	Transfer Read Buffer to 8 LSB of B Reg. cleared	
OME 071	103071	Transfer Memory 8 LSB to Write Buffer	
OAR 071	103171	Transfer A Register 8 LSB to Write Buffer	
OBR 071	103271	Transfer B Register 8 LSB to Write Buffer	
		_	
C. Sense			
SEN 0171	101171	Write Buffer Empty	
SEN 0271	101271	Read Buffer Full	
SEN 0371	101371	Carrier On	
SEN 0471	101471	Clear to Send	

## Notes:

- 1. All commands listed are used for 201A3 Dataset operation.
- 2. EXC 571 is not necessary for 201B1 (true) full-duplex operation.
- 3. SEN 371 and SEN 471 will always be ON if Request to Send is left on at both ends when using 201B1. Carrier On also comes ON when outputting using a 201A3 dataset.
- 4. 201A3 = Half-Duplex 2 wire. 201B1 = Full-Duplex 4 wire.

Table H-12 620/i-66 Data Set Coupler Instructions

Mnemonic	Octal Code	Functional Description
A. External Control		
EXC 0471 EXC 0271	100471 100271	Initialize Select Load MCR

## Notes:

- 1. All commands listed are used for 103A2 Dataset operation.
- 2. Request to Send and Clear to Send could be substituted for SEN 371 and SEN 471 commands if desired.
- 3. 103A = Dialup; 103F = Private Line.
- 4. Device address listed is 71; any other device address may be used according to system requirements.

Table H-13 620/i-72 Digital Plotter Controller Instructions

Mnemonic	Octal Code	Functional Description
A. External Control	e e	
EXC 032	100032	BIC to DPC Enable
B. Transfer		
OME 032	103032	Transfer Memory to Buffer
OAR 032	103132	Transfer A Register to Buffer
OBR 032	103232	Transfer B Register to Buffer
C. Sense		
SEN 0132	101132	Sense Buffer Ready

Table H-14 620/i-80 Buffered I/O Controller Instructions

Mnemonic	Octal Code	Functional Description
A. External Control		
EXC 0X6Z*	100X6Z	Output control pulse on line selected by X from controller addressed by Z.
B. Sense		
SEN 0X6Z	101X6Z	Test state of line selected by X from controller addressed by Z.
C. Input Data		
IME 06Z	10206Z	Read input buffer of controller addressed by Z into memory.
INA 016Z	10216Z	Read input buffer of controller addressed by Z into B register.
INB 026Z	10226Z	Read input buffer of controller addressed by Z into B register.
CIA 056Z	10256Z	Clear A register and read controller input buffer addressed by Z.
CIB 066Z	10266Z	Clear B register and read controller input buffer addressed by Z.
D. Output Data		
ØME 06Z	10306Z	Load output buffer of controller addressed by Z from memory.
ØAR 016Z	10316Z	Load output buffer of controller addressed by Z from A register.
ØBR 026Z	10326Z	Load output buffer of controller addressed by Z from B register.

<sup>\*6</sup>Z = Device address (60-67). Determined on individual system basis by wiring on backplane of peripheral expansion chassis.

<sup>\*</sup>X = Discrete control/sense line (0-7).

Table H-15 620/i-81 Digital I/O Controller Instructions

Mnemonic	Octal Code	Functional Description
A. External Control		
EXC	100XZZ*	Select device address of ZZ and initiate a control pulse on line X.
B. Sense		
SEN	101XZZ	Select device address of ZZ and test logical state of sense response line X.

<sup>\*</sup>ZZ = Device address  $60_8$  to  $67_8$ 

Table H-16 620/i-83 Relay Contact I/O Module Instructions

Mnemonic	Octal Code	Functional Description
A. External Control		
EXC ODA	1000DA	Clear All Outputs. Causes all 16 output contacts to open.
EXC 1DA	1001DA	Clear All Inputs. Returns all input bits that are not being set by contact closure to zero.
B. Sense		
SEN ODA	1010DA	Sense Contact Closed. This command is available as an option. A specified contact closure will cause a jump to the jump address to occur.

<sup>\*</sup> X = Control or sense line 0 through 7

620/i-83 Relay Contact I/O Module Instructions (Contd)

Mnemonic	Octal Code	Functional Description
C. Transfer In		
INA 0DA	1020DA	Input to A register. Input relay buffered input data on module to A register.
CIA ODA	1020D A	Clear and Input to A register. Input relay buffered input data on module to A register cleared.
INB ODA	1020DA	Input to B register. Input relay buffered input data on module to B register.
CIB ODA	1020DA	Clear and Input to B register. Input relay buffered input data on module to B register cleared.
IME ODA, ADDR	1020DA	Input to Memory. Input relay buffered input data on module to memory.
D. Transfer Out		
OAR ODA	1030DA	Output from A Register. Output A register to the buffered relay output contacts.
OBR ODA	1030D A	Output from B Register. Output B register to buffered relay contact outputs.
OME ODA, ADDR	1030DA	Output from Memory. Output memory to buffered relay contact outputs.

Table H-17 620/i-85 Analog Input System Instructions

Mnemonic	Octal Code	Description
EXC 054 EXC 0154	100 054 100 154	Initializes the AIS system. The Program Control Mode.
EXC 0254	100 254	Places the AIS in the SCAN mode.
EXC 0354	100 354	Start conversion command for the first conversions in the SCAN mode.
SEN 054	101054	This SEN indicates the conversion data is ready. The data must be taken within 40 microseconds of the start of the SEN or the data will be replaced by new conversion data if operating at maximum throughput.
SEN 0154	101 154	This SEN indicates the AIS is requesting a new multiplexer address.
SEN 0254	101 254	This SEN indicates the AIS has completed the multiplexer address SCAN.
DTO INSTRUCTION OAR, OBR, OME		Data Transfer Out - In the program mode the DTO occurs for each multiplexing address given to the AIS. In the SCAN Mode, a DTO occurs for the first (preset) address.
DTI INSTRUCTIONS CIA 054 CIB 054 INA 054 INB 054 IME 054		Data Transfer In – After each conversion the data for that conversion is ready and a DTI transfers it into the 620/i. If the throughput rate is 20,000, the DTI must occur within 40 microseconds of the data ready signal.

Appendix J Composite Equipment List This appendix provides a composite equipment list for the 620/i Computer System.

# SYSTEMS COMPUTER

MODEL #	DESCRIPTION	PREREQUISITES
620/i-00	Systems Computer equipped with 4096 words (16 bit) core memory, console, programmed party line I/O and power supply	None
622/i-00	Systems Computer equipped with 4096 words (18 bit) core memory, console, programmed party line I/O	
620/i-01 620/i-02A	and power supply	None
620/i-02B	(left hand module)	620/i-01
020/1 025	(right hand module)	620/i-01 620/i-95-5
622/i-02A	Memory increment 4096 words by 18 bits (left hand module)	622/i-01
622/i-02B	Memory increment 4096 words by 18 bits (right hand module)	
620/i-03	Memory Parity option, 1st 4K (16 bit)	620/i-00
620/i-04	Memory Parity option per memory module (16 bit)	620/i-03
620/i-05	Memory Protect (16 bit or 18 bit computer)	622/i-00
620/i-06	First TTY ASR 33 and adaptor	620/i-00
620/i-07	First TTY KSR 35 and adaptor	620/i-00
620/i-08	First TTY ASR 35 and adaptor	620/i-00
620/i-10	Hardware Multiply/Divide and Extended Addressing	620/i-00
620/i-11	I/O Party Line negative logic	620/i-00
620/i-12	Direct Memory Access and Interrupt logic	620/1-00
620/i-13	Real Time Clock	620/1-12
620/i-14	Power Failure/Restart	020/1-12
620/i-15	Micro-Exec facility	02U/ I-UU
620/i-16	Priority Interrupt Module, 8 multilevel, AC	020/1-12

### MODEL # DESCRIPTION **PREREQUISITES** CARD EQUIPMENT AND BUFFER INTERLACE CONTROLLER 620/i-20 Buffer Interlace Controller, provides block transfer capabilities to 19 peripheral controllers . . . . . . . . . . . 620/i-01 620/i-12 620/i-95-5 620/i-95-6 Card Reader and Controller, 1,000 cards per minute . . . . 620/i-01 620/i-22 620/i-95-5 620/i-95-6 620/i-23 Card Reader and Controller, 200 cards per minute . . . . . 620/i-01 620/i-95-5 620/i-95-6 620/i-26 Card Punch and Controller, 300 cards per minute . . . . . . 620/i-01 620/i-95-5 620/i-95-6 MAGNETIC TAPE AND CONTROLLER 620/i-30 Magnetic Tape Unit and Controller, 9 track, 800 bpi, 25 ips (consists of two socket boards) . . . . . . . . . . . . . . . 620/i-01 620/i-95-5 620/i-95-6 620/i-31 Magnetic Tape Unit and Controller, 7 track, Single Density (200, 556, 800 bpi), 25 ips (consists of two 620/i-01 620/i-95-5 620/i-95-6 The following controllers (Model 620/i-32 through 620/i-37) use Versa Logic packaging. 620/i-32A Magnetic Tape Transport and Controller, 7 track, 45 ips, 620/i-32B Magnetic Tape Transport and Master Controller, 7 track, 45 ips, dual density...... 620/i-11 Slave Transport for model 620/i-32B (three slave transports 620/i-32C 620/i-32B 620/i-33A Magnetic Tape Transport and Controller, 7 track, 75 ips,

MODEL #	DESCRIPTION	PREREQUISITES
620/i-33B	Magnetic Tape Transport and Master Controller,	420 /: 11
620/i-33C	7 track, 75 ips, dual density	
620/i-34A	transports per 620/i-33B)	. 620/i-33B
7	120 ips, dual density	. 620/i-11 620/i-12 620/i-20
620/i-34B	Magnetic Tape Transport and Master Controller,	
	7 track, 120 ips, dual density	. 620/i-11 620/i-12 620/i-20
620/i-34C	Slave Transport for model 620/i-34B (three slave transports per 620/i-34B)	. 620/i-34B
620/i-35A	Magnetic Tape Transport and Controller, 9 track,	•
620/i-35B	45 ips, 800 bpi	. 620/i-11
620/i-35C	9 track, 45 ips, 800 bpi	. 620/i-11
·	Slave Transport for model 620/i-35B (three slave transports per 620/i-35B)	. 620/i-35B
620/i-36A	Magnetic Tape Transport and Controller, 9 track, 75 ips, 800 bpi	
620/i-36B	Magnetic Tape Transport and Master Controller,	,
620/i-36C	9 track, 75 ips, 800 bpi	. 620/i-11
620/i-37A	transports per 620/i-36B)	. 620/i-36B
020/1-3/A	Magnetic Tape Transport and Controller, 9 track, 120 ips, 800 bpi	. 620/i-11 620/i-12 620/i-20
620/i-37B	Magnetic Tape Transport and Master Controller,	•
	9 track, 120 ips, 800 bpi	. 620/i-11 620/i-12 620/i-20
620/i-37C	Slave Transport for model 620/i-37B (three slave	•
	transports per $620/i-37B$ )	. 620/i-37B

### MODEL # **PREREQUISITES** DESCRIPTION ROTATING MEMORY AND PAPER TAPE 620/i-40 Rotating Memory and Controller, fixed head disc, average access time 17 ms, transfer rate 30K words per second, capacity 32,768 words (16 or 18 bit) . . . . . . . 620/i-01 620/i-95-5 620/i-95-6 620/i-41 Rotating Memory and Controller, fixed head disc, average access time 17 ms, transfer rate 30K words per second, capacity 65,536 words (16 or 18 bit) . . . . . . 620/i-01 620/i-95-5 620/i-95-6 620/i-42 Rotating Memory and Controller, fixed head disc, average access time 17 ms, transfer rate 30K words per second, capacity 131,072 words (16 or 18 bit).... 620/i-01 620/i-95-5 620/i-95-6 620/i-43 Rotating Memory and Controller, fixed head disc, average access time 17 ms, transfer rate 30K words per second, capacity 262, 144 words (16 or 18 bit).... 620/i-01 620/i-95-5 620/i-95-6 620/i-01 620/i-50 620/i-95-5 620/i-95-6 620/i-01 620/i-50A 620/i-95-5 620/i-95-6 620/i-01 620/i-51 620/i-95-5 620/i-95-6 Paper Tape System, includes time-share controller, 620/i-52 620/i-01 620/i-95-5 620/i-95-6 620/i-52A Paper Tape System, includes time-share controller, 620/i-01 620/i-95-5 620/i-95-6

MODEL #	DESCRIPTION	PREREQUISITES
620/i-53	Spooler, a bidirectional spooler used in conjunction with models 620/i-51 and 620/i-52, paper tape readers. Rewind speed is 200 inches/sec. average. 8 inch NAB reels	. None
	ANALOG/DIGITAL/COMMUNICATIONS CONTROLLERS	
620/i-60	Communication and Terminal Controller. Provides multiplexer and control for up to sixteen (four 620/i-61's) 103 type modems	. 620/i-12 620/i-01
620/i-61	Communication Line-Control Module. Provides interface	620/i-95-5 620/i-95-6 620/i-60
	between Communications Terminal Controller (620/i-60) and four 103 type modems	. 620/i-01 620/i-95-5 620/i-95-6
620/i-65	Data Set Coupler Interface for 201 modem	. 620/i-01 620/i-95-5 620/i-95-6
620/i-66A	Data Set Coupler provides interface between 103 type modem and the 620/i programmed I/O	,
620/i-66B	Two 620/i-66A's mounted in one controller module	. 620/i-01 620/i-95-5 620/i-95-6
620/i-72	Digital Plotter, 300 steps per second	620/i-75-6 620/i-95-5 620/i-95-6
620/i-73	Oscilloscope Display (Tektronix model RM503) plots point to point, 10 bits axis (special ADC power supply	,
	and socket board, or rack mounted system)	. 620/i-01 620/i-95-5 620/i-95-6
620/i-75	Line Printer, 300 Ipm, 120 columns, unbuffered (Versa Logic packaging)	. 620/i-01 620/i-95-5 620/i-95-6 620/i-12

MODEL #	DESCRIPTION	PREREQUISITES		
620/i-80	Buffered I/O Controller. 8 sense lines, 8 control pulses, 16 bit output register, 16 bit input register	. 620/i-01 620/i-95-5 620/i-95-6		
620/i-81	Digital I/O Controller. 8 sense lines, 8 control pulses	. 620/i-01 620/i-95-5 620/i-95-6		
620/i-83-1	Relay Contact I/O Module, 16 mercury wetted contact outputs	. 620/i-01 620/i-95-5 620/i-95-6		
620/i-83-2	Relay Contact I/O Module, 16 contact inputs	. 620/i-01 620/i-95-5 620/i-95-6		
620/i-83-3	Relay Contact I/O Module, 16 mercury wetted contact outputs. 16 contact inputs	. 620/i-01 620/i-95-5 620/i-95-6		
620/i-85	Analog Input System ADC (12 bits resolution) S/H amplifier, 16 differential channel multiplexer and controller (special ADC power supply required)	. 620/i-01 620/i-95-5 620/i-95-6		
620/i-85-1	Additional 16 differential channel multiplexer switches (3 per 620/i-85)	. 620/i-85 620/i-01 620/i-95-5 620/i-95-6		
620/i-87	Dual D-A Converter 12 Bit, .1% bi-polar (special ADC power supply and socket board, or rack mounted system)	. 620/i-93-6 620/i-95-5 620/i-95-6		
620/i ACCESSORIES AND SPARES				
620/i-06-A 620/i-06-B 620/i-06-C 620/i-07-A 620/i-07-B	First Teletype Controller (for ASR 33/35 or KSR 35) Teletype ASR 33 spare, without controller Teletype ASR 33 – 115 Volt, 50 Hz spare, without controller Teletype KSR 35 spare, without controller	er		

#### MODEL # DESCRIPTION 620/i-08-A 620/i-08-B Teletype ASR 35 - 115V, 50 Hz spare, without controller . . . . . . . . . 620/i-90 19-inch Cabinet: 30 inches deep, 63-inch panel height, includes 620/i-90-A 19-inch Cabinet: 30 inches deep, 63 inches high, side panels, cooling unit, with casters ............. 620/i-92-0 I/O Cable consisting of a cable of optional length (5' increments to 20') with 75 pin male connectors at each end and two female 620/i-92-1 I/O Cable consisting of a cable of optional length (5' increments to 25') with 104 pin male connectors at each end and two female 620/i-92-2 104-Pin Chassis Mount Connector Set - matching connector pair with all necessary hardware for mounting, wiring, and keying 620/i-92-3 75-Pin Chassis Mount Connector Set - matching connector pair with all necessary hardware for mounting, wiring, and keying (standard I/O Bus.).................. 620/i-92-4 26-Pin Chassis Mount Connector Set - matching connector pair with all necessary hardware for mounting, wiring, and keying . . . . . . . 620/i-92-5 I/O Connector Tool Kit consisting of crimp tool, removal tool 620/i-92-6 Interrupt Cable consisting of a cable of optional length (10' or 20') with a 46 pin edge board connector and a 26 pin male connector. Included is the female 26 pin connector and miscellaneous mounting 620/i-92-7 44 Pin Edge Board Connector and Hood Assembly . . . . . . . . . . . . . . . . . . 620/i-92-8 620/i-95-1 620/i-95-2 Spares Kit, Components............. 620/i-95-3 Spares Core Stack Assembly and Memory Regulator Module - Timing 620/i-95-4 Spare Core Stack Assembly and Memory Regulator Module – Timing 620/i-95-5 620/i-95-6 Peripheral Controller Chassis back plane wiring panel (R.H.) . . . . . . . 620/i-95-7 Peripheral Controller Chassis back plane wiring panel (L.H.) . . . . . . .
